

TITLE OF INVENTION: ACCESS RIGHT MANAGEMENT

ABSTRACT

The present invention relates to a method for controlling a generation of at least one access code. The method comprises: receiving (210), in an access control device (122), data representing an access code; verifying (220) the data representing the access code; in response to a detection in a verification that the access code is valid generating (230) a signal causing a generation of data representing a new access code; and generating (250) a signal causing a transmit of the data representing the new access code to a party from whom the data representing the access code is received. Some aspects of the invention relate to an access control device, to a computer program product and to a system.
