ABSTRACT

In an operating panel for an elevator, destination floor registering buttons and floor information display portions are disposed in a touch panel portion to be adjacent to one another, and an indicator bar for indicating a position of a car is disposed between the destination floor registering buttons and the floor information display portions. When the destination floor registering buttons are operated in the car, their display configurations are changed. Further, when the hall button devices are operated, the display configurations, i.e., colors and/or display areas, of the corresponding floor information display portions are also changed.
