

Abstract

The invention relates to a drive system for opening, respectively closing a leaf of a door, of a window or the like, having a housing (1), a closing spring (2) disposed in
5 the housing (1), which spring acts upon a piston (3) being, via a toothing, in an operative connection with a closer shaft (4) supported in the housing (1). With the intention to improve such drive system with regard to the choice of material, according to the invention it is intended that the
10 piston (3) and the housing (1) consist of the plastic material polyoxymethylene (POM).
