

ABSTRACT

APPARATUS FOR CONNECTING TO A RISER

There is an apparatus for connecting to a riser, the apparatus comprising a bell
5 mouth body for allowing the riser to pass therethrough, at least one set of bell
mouth stoppers for adjusting an orientation of the bell mouth body and an upper
cover for locking the bell mouth body at the orientation; wherein the bell mouth
body comprises a ring configured around an outer surface of the bell mouth
10 body and wherein the at least one set of bell mouth stoppers is configured to
engage the upper cover with the ring.
