

Abstract

To provide a bed apparatus that facilitates the operator to work on electric generation in generating electricity with a hand-crank generator, can reduce the temporal and physical burden on the operator, and can secure safety for a person who does not understand uses and others. An electric power path (electric power cable) 58 is laid from a relay box 50 to an electric actuator 31 for a back bottom 22 and an electric actuator 34 for a leg bottom 26 so as to supply electric power via the path. Electric actuator 31 or 34 can be driven depending on selection of insertion to socket 50b or 50b in this relay box 50.
