[0001] The present application claims priority under 35 U.S.C. § 119(e) to U.S. Provisional application number 60/655,927, filed February 24, 2005, entitled "PGD2 Receptor Antagonists for the Treatment of Inflammatory Diseases", the entire contents of which is hereby incorporated by reference.

BACKGROUND OF THE INVENTION

[0002] CRTH2 is a G protein-coupled chemoattractant receptor expressed on Th2 cells (Nagata *et al.*, *J. Immunol.*, **1999**, *162*, 1278-1286), eosinophils, and basophils (Hirai *et al.*, *J. Exp. Med.*, **2001**, *193*, 255-261). Prostaglandin D2 (PGD2) is a natural ligand for CRTH2, and is the major inflammatory mediator produced from mast cells. It has been shown that activation of CRTH2 by PGD2 induces migration and activation of Th2 cells (Hirai *et al.*, *J. Exp. Med.* **2001**, *193*, 255-261; Gervais *et al.*, *J. Allergy Clin. Immunol.* **2001**, *108*, 982-988) which in turn are involved in the orchestration of an allergic inflammatory response by directly or indirectly inducing migration, activation, priming and prolonged survival of effector cells, such as eosinophils and basophils (Sanz *et al.*, *J. Immunol.* **1998**, *160*, 5637-5645; Pope *et al.*, *J. Allergy Clin. Immunol.* **2001**, *108*, 594-601; Teran L. M., *Clin. Exp. Allergy* **1999**, *29*, 287-290). The role of PGD2 in the initiation and maintenance of allergic inflammation has also been demonstrated in mouse models of asthma by showing that overproduction of PGD2 in vivo by PGD2 synthase exacerbates airway inflammation (Fujitani *et al.*, *J. Immunol.* **2002**, *168*, 443-449).

[0003] Accordingly, compounds which are modulators, preferably inhibitors, of the interaction between CRTH2 and PGD2 should be useful for the treatment of diseases and disorders that are mediated by CRTH2, PGD2, Th2 cells, eosinophils, and/or basophils. These diseases include but are not limited to allergic disorders, asthmatic disorders, and inflammatory disorders such as allergic rhinitis, allergic asthma, bronchoconstriction, atopic dermatitis and systemic inflammatory disorders.

[0004] It has now been found that compounds of this invention, and pharmaceutically acceptable compositions thereof, are effective as inhibitors of the interaction between CRTH2 and its natural ligand PGD2. Thus, compounds of the invention and pharmaceutical compositions thereof are useful for treating inflammatory disorders and/or disorders with an inflammatory component.

[0017] Unless otherwise indicated, an aliphatic or heteroaliphatic group, or a non-aromatic heterocyclic ring may contain one or more substituents and thus may be "optionally substituted". In addition to the substituents defined above and herein, suitable substituents on the saturated carbon of an aliphatic or heteroaliphatic group, or of a non-aromatic heterocyclic ring are selected from those listed above for the unsaturated carbon of an aryl or heteroaryl group and additionally include the following: $=\text{O}$, $=\text{S}$, $=\text{NNHR}^*$, $=\text{NN(R}^*)_2$, $=\text{NNHC(O)R}^*$, $=\text{NNHCO}_2(\text{alkyl})$, $=\text{NNHSO}_2(\text{alkyl})$, or $=\text{NR}^*$, where each R^* is independently selected from hydrogen or an optionally substituted C_{1-6} aliphatic group.

[0018] In addition to the substituents defined above and herein, optional substituents on the nitrogen of a non-aromatic heterocyclic ring also include and are generally selected from -R^+ , $\text{-N(R}^+)_2$, -C(O)R^+ , $\text{-CO}_2\text{R}^+$, -C(O)C(O)R^+ , $\text{-C(O)CH}_2\text{C(O)R}^+$, $\text{-SO}_2\text{R}^+$, $\text{-SO}_2\text{N(R}^+)_2$, $\text{-C(=S)N(R}^+)_2$,

[0019] As detailed above, in some embodiments, two independent occurrences of R^o (or R^+ or any other variable similarly defined in the specification and claims herein), are taken together with their intervening atom(s) to form an optionally substituted 3-12 membered saturated, partially unsaturated, or fully unsaturated monocyclic or bicyclic ring having 0-4 heteroatoms independently selected from nitrogen, oxygen, or sulfur.

[0020] Exemplary rings that are formed when two independent occurrences of R^o (or R^+ , or any other variable similarly defined in the specification and claims herein), are taken together with their intervening atom(s) include, but are not limited to the following: a) two independent occurrences of R^o (or R^+ , or any other variable similarly defined in the specification or claims herein) that are bound to the same atom and are taken together with that atom to form a ring, for example, $N(R^o)_2$, where both occurrences of R^o are taken together with the nitrogen atom to form a piperidin-1-yl, piperazin-1-yl, or morpholin-4-yl group; and b) two independent occurrences of R^o (or R^+ , or any other variable similarly defined in the specification or claims herein) that are bound to different atoms and are taken together with both of those atoms to form a ring, for example where a phenyl group is substituted with

two occurrences of OR^o , these two occurrences of R^o are taken together with the oxygen atoms to which they are bound to form a fused 6-membered oxygen containing ring:

. It will be appreciated that a variety of other rings (e.g., also spiro, and bridged rings) can be formed when two independent occurrences of R^o (or R^+ , or any other variable similarly defined in the specification and claims herein) are taken together with their intervening atom(s) and that the examples detailed above are not intended to be limiting.

[0021] Unless otherwise stated, structures depicted herein are also meant to include all isomeric (e.g., enantiomeric, diastereomeric, and geometric (or conformational)) forms of the structure; for example, the *R* and *S* configurations for each asymmetric center, (*Z*) and (*E*) double bond isomers, and (*Z*) and (*E*) conformational isomers. Therefore, single stereochemical isomers as well as enantiomeric, diastereomeric, and geometric (or conformational) mixtures of the present compounds are within the scope of the invention. Unless otherwise stated, all tautomeric forms of the compounds of the invention are within the scope of the invention. Additionally, unless otherwise stated, structures

depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds having the present structures except for the replacement of hydrogen by deuterium or tritium, or the replacement of a carbon by a ^{13}C - or ^{14}C -enriched carbon are within the scope of this invention.

[0090] 4. Uses, Formulation and Administration

[0091] As discussed above, the present invention provides compounds that are useful as inhibitors of CRTH2, and thus compounds of the invention are useful for treating (therapeutically or prophylactically) disorders with an inflammatory component and allergic conditions. Compounds of the invention can also be used to treat inflammatory disorders and allergic conditions mediated by Th2 cells, eosinophils, and basophils.

[0092] Accordingly, in another aspect of the present invention, pharmaceutically acceptable compositions are provided, wherein these compositions comprise any of the compounds as described herein, and optionally comprise a pharmaceutically acceptable carrier, adjuvant or vehicle. In certain embodiments, these compositions optionally further comprise one or more additional therapeutic agents.

[0093] It will also be appreciated that certain of the compounds of present invention can exist in free form for treatment, or where appropriate, as a pharmaceutically acceptable derivative thereof. According to the present invention, a pharmaceutically acceptable derivative includes, but is not limited to, pharmaceutically acceptable prodrugs, salts, esters, salts of such esters, or any other adduct or derivative which upon administration to a patient in need is capable of providing, directly or indirectly, a compound as otherwise described herein, or a metabolite or residue thereof.

[0094] As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge *et al.*, describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, **1977**, 66, 1-19, incorporated herein by reference. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. Salts derived from appropriate bases include alkali metal, alkaline earth metal, ammonium and $N^+(C_{1-4}alkyl)_4$ salts. This invention also envisions the quaternization of any basic nitrogen-containing groups of the compounds disclosed herein. Water or oil-soluble or dispersible products may be obtained by such quaternization. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, loweralkyl sulfonate and aryl sulfonate.

[0095] As described above, the pharmaceutically acceptable compositions of the present invention additionally comprise a pharmaceutically acceptable carrier, adjuvant, or vehicle, which, as used herein, includes any and all solvents, diluents, or other liquid vehicle, dispersion or suspension

aids, surface active agents, isotonic agents, thickening or emulsifying agents, preservatives, solid binders, lubricants and the like, as suited to the particular dosage form desired. Remington's Pharmaceutical Sciences, Sixteenth Edition, E. W. Martin (Mack Publishing Co., Easton, Pa., 1980) discloses various carriers used in formulating pharmaceutically acceptable compositions and known techniques for the preparation thereof. Except insofar as any conventional carrier medium is incompatible with the compounds of the invention, such as by producing any undesirable biological effect or otherwise interacting in a deleterious manner with any other component(s) of the pharmaceutically acceptable composition, its use is contemplated to be within the scope of this invention. Some examples of materials which can serve as pharmaceutically acceptable carriers include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, or potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, polyacrylates, waxes, polyethylene-polyoxypropylene-block polymers, wool fat, sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil; safflower oil; sesame oil; olive oil; corn oil and soybean oil; glycols; such a propylene glycol or polyethylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

[0096] In another aspect, a method for the treatment of an inflammatory disease or a disease with an inflammatory component is provided comprising administering an effective amount of a compound, or a pharmaceutical composition thereof to a subject in need thereof. Compounds and compositions of the invention are inhibitors of CRTH2, and thus, without wishing to be bound by any particular theory, the compounds and compositions are particularly useful for treating or lessening the severity of a disease, condition, or disorder where activation of one or more of CRTH2, PGD2 (including DP activity), Th2 cells, eosinophils, and/or basophils is implicated in the disease, condition, or disorder. When activation of one or more of CRTH2, PGD2 (including DP activity), Th2 cells, eosinophils, and/or basophils is implicated in a particular disease, condition, or disorder, the disease, condition, or disorder may also be referred to as a "CRTH2-mediated disease" or disease symptom. Accordingly, in another aspect, the present invention provides a method for treating or

lessening the severity of a disease, condition, or disorder where activation of one or more of CRTH2, PGD2 (including DP activity), Th2 cells, eosinophils, and/or basophils is implicated in the disease state.

[0097] In certain embodiments of the present invention an "effective amount" of the compound or pharmaceutically acceptable composition is that amount effective for treating an inflammatory disease or disease with an inflammatory component. In other embodiments, an "effective amount" of a compound is an amount which inhibits binding of PGD2 to its receptor CRTH2 and thereby inhibits one or more processes mediated by the binding in a subject, for example, the release of proinflammatory mediators. An "effective amount" of a compound can achieve a desired therapeutic and/or prophylactic effect, such as an amount which results in the prevention of or a decrease in the symptoms associated with an inflammatory disease or a disease mediated by one or more of CRTH2, PGD2 (including DP activity), Th2 cells, eosinophils, and basophils.

[0098] In one embodiment, the inflammatory disease is an allergic condition. Examples of allergic conditions for which the disclosed compounds, pharmaceutical compositions and methods are believed to be particularly effective include atopic dermatitis, allergic rhinitis, rheumatoid arthritis, chronic obstructive pulmonary disorder (COPD), COPD exacerbations, or allergic asthma. Other allergic conditions include systemic anaphylaxis or hypersensitivity responses, drug allergies (e.g., to penicillin, cephalosporins), insect sting allergies and dermatoses such as dermatitis, eczema, atopic dermatitis, allergic contact dermatitis and urticaria.

[0099] Examples of diseases with an inflammatory component for which the disclosed compounds, pharmaceutical composition and methods are believed to be particularly effective include osteoarthritis, inflammatory bowel disease [e.g., such as ulcerative colitis, Crohn's disease, ileitis, Celiac disease, nontropical Sprue, enteritis, enteropathy associated with seronegative arthropathies, microscopic or collagenous colitis, eosinophilic gastroenteritis, or pouchitis resulting after proctocolectomy, and ileoanal anastomosis] and disorders of the skin [e.g., psoriasis, erythema, pruritis, and acne].

[00100] Many autoimmune diseases also have an inflammatory component. Examples include multiple sclerosis, systemic lupus erythematosus, myasthenia gravis, juvenile onset diabetes, glomerulonephritis and other nephritides, autoimmune thyroiditis, Behcet's disease and graft rejection (including allograft rejection or graft-versus-host disease). The inflammatory component of these disorders is believed to be mediated, at least in part, by CRTH2.

[00101] Diseases characterized by reperfusion have an inflammatory component that is believed to be mediated, at least in part by, by CRTH2. Examples include stroke, cardiac ischemia, and the like. The disclosed compounds and compositions also can be used to treat these disorders.

[00102] Other diseases and conditions with an inflammatory component believed to be mediated by CRTH2 include mastitis (mammary gland), vaginitis, cholecystitis, cholangitis or pericholangitis

(bile duct and surrounding tissue of the liver), chronic bronchitis, chronic sinusitis, chronic inflammatory diseases of the lung which result in interstitial fibrosis, such as interstitial lung diseases (ILD) (e.g., idiopathic pulmonary fibrosis, or ILD associated with rheumatoid arthritis, or other autoimmune conditions), hypersensitivity pneumonitis, collagen diseases and sarcoidosis. Yet other diseases or conditions with inflammatory components which are amenable to treatment according to methods disclosed herein include vasculitis (e.g., necrotizing, cutaneous, and hypersensitivity vasculitis), spondyloarthropathies, scleroderma, atherosclerosis, restenosis and myositis (including polymyositis, dermatomyositis), pancreatitis and insulin-dependent diabetes mellitus.

[00103] In a preferred embodiment, the invention provides a method of treating asthma comprising administering an effective amount of a compound of general formula I (and subsets thereof as described herein) to a subject in need thereof.

[00104] The compounds and compositions, according to the method of the present invention, may be administered using any amount and any route of administration effective for treating an inflammatory disease or allergic condition. The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the infection, the particular agent, its mode of administration, and the like. The compounds of the invention are preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed, and like factors well known in the medical arts. The term "patient", as used herein, means an animal, preferably a mammal, and most preferably a human.

[00105] The pharmaceutically acceptable compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain embodiments, the compounds of the invention may be administered orally or parenterally at dosage levels of about 0.01 mg/kg to about 50 mg/kg and preferably from about 1 mg/kg to about 25 mg/kg, of subject body weight per day, one or more times a day, to obtain the desired therapeutic effect.

[00106] Liquid dosage forms for oral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

[00107] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

[00108] The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

[00109] In order to prolong the effect of a compound of the present invention, it is often desirable to slow the absorption of the compound from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the compound then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered compound form is accomplished by dissolving or suspending the compound in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the compound in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compound to polymer and the nature of the particular polymer employed, the rate of compound release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the compound in liposomes or microemulsions that are compatible with body tissues.

[00110] Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

[00111] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

[00112] Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

[00113] The active compounds can also be in micro-encapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such as magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they

release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes.

[00114] Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

[00115] It will also be appreciated that the compounds and pharmaceutically acceptable compositions of the present invention can be employed in combination therapies, that is, the compounds and pharmaceutically acceptable compositions can be administered concurrently with, prior to, or subsequent to, one or more other desired therapeutics or medical procedures. The particular combination of therapies (therapeutics or procedures) to employ in a combination regimen will take into account compatibility of the desired therapeutics and/or procedures and the desired therapeutic effect to be achieved. It will also be appreciated that the therapies employed may achieve a desired effect for the same disorder (for example, an inventive compound may be administered concurrently with another agent used to treat the same disorder), or they may achieve different effects (e.g., control of any adverse effects). As used herein, additional therapeutic agents which are normally administered to treat or prevent a particular disease, or condition, are known as "appropriate for the disease, or condition, being treated".

[00116] For example, compounds of the invention can also be administered in combination with one or more additional therapeutic agents, such as, theophylline, β -adrenergic bronchodilators, corticosteroids, antihistamines, antiallergic agents, immunosuppressive agents (*e.g.*, cyclosporin A, FK-506, prednisone, methylprednisolone), hormones (*e.g.*, adrenocorticotrophic hormone (ACTH)), cytokines (*e.g.*, interferons (*e.g.*, IFN β -1a, IFN δ -1b)) and the like.

[00117] The amount of additional therapeutic agent present in the compositions of this invention will be no more than the amount that would normally be administered in a composition comprising that therapeutic agent as the only active agent. Preferably the amount of additional therapeutic agent in the presently disclosed compositions will range from about 50% to 100% of the amount normally present in a composition comprising that agent as the only therapeutically active agent.

[00118] The compounds of this invention or pharmaceutically acceptable compositions thereof may also be incorporated into compositions for coating implantable medical devices, such as prostheses, artificial valves, vascular grafts, stents and catheters. Accordingly, the present invention, in another aspect, includes a composition for coating an implantable device comprising a compound of the present invention as described generally above, and in classes and subclasses herein, and a carrier suitable for coating said implantable device. In still another aspect, the present invention includes an implantable device coated with a composition comprising a compound of the present invention as described generally above, and in classes and subclasses herein, and a carrier suitable for coating said implantable device.

[00119] Another aspect of the invention relates to inhibiting CRTH2 activity in a biological sample or a patient, which method comprises administering to the patient, or contacting said biological sample with a compound of formula I or a composition comprising said compound. The term "biological sample", as used herein, includes, without limitation, cell cultures or extracts thereof; biopsied material obtained from a mammal or extracts thereof; and blood, saliva, urine, feces, semen, tears, or other body fluids or extracts thereof.

[00120] Inhibition of CRTH2 activity in a biological sample is useful for a variety of purposes that are known to one of skill in the art. Examples of such purposes include, but are not limited to, blood transfusion, organ-transplantation, biological specimen storage, and biological assays.

[00123] Scheme 1

[00124] A round bottom flask with magnetic stirrer was charged with (2-nitro-phenyl)-acetic acid (10.0 g, 55.0 mmol) and methanol (70 mL) under an argon atmosphere. To the resulting yellow solution at room temperature was added thionyl chloride (12.1 mL, 166 mmol) dropwise via addition funnel (Note: Reaction is very exothermic). The resulting reaction mixture was stirred at room temperature for 12-18 hours and concentrated *in vacuo* to afford 13.3 g of crude (2-nitro-phenyl)-acetic acid methyl ester as an orange oil. This material was used directly in subsequent reactions.

[00125] A three-neck round bottom flask with magnetic stirrer was charged with crude (2-nitro-phenyl)-acetic acid methyl ester (7.23 g, 37.0 mmol), potassium carbonate (46.1 g, 33.3 mmol), 18-crown-6 (0.650 g), and potassium iodide (0.650 g) under an argon atmosphere. To the flask was added acetonitrile (80 mL) and the mixture heated at 70 °C for one hour. To the reaction was added chloroacetone (3.50 mL, 44.0 mmol) and the reaction stirred at 70 °C under argon for 18-20 hours. The reaction was cooled to room temperature and filtered through a pad of celite. The resulting filtrate was concentrated *in vacuo* to afford 9.64 g of crude material. Purification via flash chromatography (0-40% ethyl acetate / hexanes eluent) yielded 4.74 g of 2-(2-nitro-phenyl)-4-oxo-pentanoic acid methyl ester (51%).

[00126] A round bottom flask with magnetic stirrer was charged with 2-(2-nitro-phenyl)-4-oxo-pentanoic acid methyl ester (4.74 g, 19.1 mmol) and anhydrous ethanol (50 mL). To the reaction was added 10% palladium on carbon (0.948 g, 20% by weight) and the reaction stirred at room temperature under a hydrogen gas atmosphere (balloon) for 18-20 hours. The reaction was filtered through a pad of celite and the celite pad washed with warm ethanol. The combined filtrates were concentrated *in vacuo* to afford an off-white colored solid. This material was purified via Isco flash system (0-20% ethyl acetate / hexanes) to yield 2.64 g of *cis*-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester as a white solid (68%). ¹H-NMR (CDCl₃) δ: 1.23 (3H, d), 1.95 (1H, dd),

[00127] General Procedure A

[00128] Scheme 2

[00129] ($\pm$)-*trans*-2-Methyl-1-(4-trifluoromethyl-benzoyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid (4-chloro-phenyl)-ethyl-amide (6)

[00130] A round bottom flask with magnetic stirrer was charged with *cis*-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (556 mg, 2.71 mmol) in methylene chloride (8.00 mL) under an argon atmosphere. Into the reaction was added 4-trifluoromethyl-benzoyl chloride (0.61 mL, 4.07 mmol) and *N,N*-diisopropylethylamine (1.20 mL, 6.89 mmol). The reaction was stirred at room temperature for 18-20 hours. The reaction was transferred to a separatory funnel containing a saturated sodium bicarbonate solution (15 mL), then diluted with methylene chloride (15 mL) and shaken vigorously. The resulting organic layer was separated, washed with brine (1 x 20 mL), dried over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* to afford an orange residue (1.359 g). The residue was purified via flash chromatography (20 % ethyl acetate / hexanes eluent) to yield *cis*-2-methyl-1-(4-trifluoromethyl-benzoyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester as a tan-colored solid (990 mg, 97%).

[00131] A round bottom flask with magnetic stirrer was charged with *cis*-2-methyl-1-(4-trifluoromethyl-benzoyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (980 mg, 2.60 mmol) in tetrahydrofuran (10.0 mL). To the reaction was added a solution of lithium hydroxide (179 mg, 7.47 mmol) in water (10 mL), followed by methanol (10 mL). The reaction was stirred at room temperature for 18-20 hours under an argon atmosphere. The reaction was transferred to a separatory funnel and the pH adjusted to 2 via addition of 1N hydrochloric acid. The mixture was extracted with ethyl acetate (3 x 35 mL) and the combined extractions were washed with brine (1 x 50 mL), dried

over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* to yield 2-methyl-1-(4-trifluoromethyl-benzoyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid (mixture of *cis* and *trans* isomers) as an off-white solid (912 mg, 97%). The mixture was used without purification in subsequent reactions.

[00132] A round bottom flask with magnetic stirrer was charged with 2-methyl-1-(4-trifluoromethyl-benzoyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid (886 mg, 2.44 mmol) in anhydrous pyridine (25.0 mL). To the reaction was added *N*-ethyl-*p*-chloroaniline (0.410 mL, 2.95 mmol), followed by EDCI (833 mg, 4.34 mmol). The reaction was stirred at room temperature under an argon atmosphere for 18-20 hours. The reaction was poured into a 1:1 mixture of water/brine (50 mL) and extracted with ethyl acetate (3 x 35 mL). The combined extractions were washed with brine (1 x 50 mL), dried over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* to afford a brown residue. [00135] ($\pm$)-*trans*-1-(4-Methoxy-benzoyl)-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid benzyl-ethyl-amide (7)

[00136] A round bottom flask with magnetic stirrer was charged with *cis*-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (5.42 g, 26 mmol) in dichloromethane (100 mL) under an argon atmosphere at room temperature. To the reaction was added *N,N*-diisopropylethylamine (11.8 mL, 68 mmol), followed by *p*-anisoyl chloride (6.31 g, 37 mmol). The reaction was stirred at room temperature for 18-20 hours and poured into saturated sodium bicarbonate (1000 mL), diluted with dichloromethane (50 mL), and shaken vigorously. The resulting organic layer was separated, washed with brine (1 x 100 mL), dried over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* to afford an oily residue. Diethyl ether (50 mL) was added to the residue and the resulting white solid was collected via suction filtration to afford *cis*-1-(4-methoxy-benzoyl)-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (6.94 g, 78%).

[00137] A round bottom flask with magnetic stirrer was charged with *cis*-1-(4-methoxy-benzoyl)-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (3.00 g, 8.8 mmol) in anhydrous tetrahydrofuran (70 mL). To the reaction was added a solution of lithium hydroxide (423 mg, 18 mmol) in water (24 mL), followed by methanol (24 mL). The reaction was stirred at room temperature for 18-20 hours under an argon atmosphere. The reaction was transferred to a separatory funnel and the pH adjusted to 2 via addition of 1N hydrochloric acid. The mixture was extracted with ethyl acetate (3 x 35 mL) and the combined extractions were washed with brine (1 x 50 mL), dried over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* and diethyl ether (50 mL) added to the resulting residue. The precipitated solid was collected via suction filtration to afford 1-(4-methoxy-benzoyl)-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid as a mixture of *cis* and *trans*-isomers (2.71 g, 95%). ¹H-NMR (d₆-DMSO) δ : 1.22 (d, 3H), 1.63 (ddd, 1H), 2.94 (ddd, 1H), 3.76 (s, 3H), 3.89 (dd, 1H), 4.83 - 4.91 (m, 1H), 6.51 (d, 1H), 6.72 - 6.76 (m, 2H), 6.95 (ddd, 1H), 7.11 (ddd, 1H), 7.26 - 7.35 (m, 3H). The solution was cooled to 0 °C. Boron tribromide (1.15 g, 0.436 mL, 4.61 mmol) was added via syringe. The reaction was warmed to room temperature and stirred. Two additional aliquots of boron tribromide (0.220 uL each) were added at one hour and two hours. [00197] ($\pm$)-1-(4-Methoxy-benzoyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid (4-chloro-phenyl)-ethyl-amide (33)

[00198] Step 1. ($\pm$)-1,2,3,4-Tetrahydro-quinoline-4-carboxylic acid.

[00199] Quinoline-4-carboxylic acid (580 mg, 3.35 mmol) was dissolved in an aqueous potassium hydroxide solution (1 M, 10 mL). Nickel/aluminum amalgam (3 g) was added in portions over 1.5 hours. The heterogeneous mixture was stirred at room temperature for 48 hours. Upon completion, the reaction was filtered through Celite® and washed with ethyl acetate. The pH of the aqueous layer was adjusted with concentrated hydrochloric acid to 4-5. Solid sodium chloride was added until the aqueous layer was saturated. The ethyl acetate layer was separated. The aqueous phase was extracted with ethyl acetate. The extracts were combined, washed with minimal brine, dried over sodium sulfate, filtered, and concentrated. 1,2,3,4-Tetrahydro-quinoline-4-carboxylic acid was used without further purification (389 mg, 66%). $^1\text{H-NMR}$ (CDCl_3) δ : 1.95 - 2.08 (m, 1H), 2.22 - 2.37 (m, 1H), 3.23 - 3.34 (m, 1H), 3.39 - 3.49 (m, 1H), 3.79 (dd, 1H), 6.56 (d, 1H), 6.69 (dd, 1H), 7.07 (dd, 1H), 7.17 (d, 1H). Anisoyl chloride (644 mg, 3.78 mmol) was added followed by diisopropylethylamine (733 mg, 1.01 mL, 15.67 mmol). The reaction was stirred at room temperature for 7 days. The mixture was concentrated and partitioned between chloroform and sodium hydroxide (1 M, aqueous). The chloroform extract was set aside. The aqueous phase was acidified with concentrated hydrochloric acid (pH = 3-4). The aqueous phase was then extracted with ethyl acetate (three times). The combined extracts were washed with brine, dried over sodium sulfate, filtered, and concentrated. The crude product was used without further purification. MS m/z: 312 (M+1).

[00262] A round bottom flask with magnetic stirrer was charged with *cis*-2-methyl-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (300 mg, 1.46 mmol) in methylene chloride (3.00 mL) under a nitrogen atmosphere. Into the reaction was added isonicotinoyl chloride hydrochloride (338 mg, 1.90 mmol) and *N,N*-diisopropylethylamine (1.02 mL, 5.84 mmol) via syringe. The reaction was stirred at room temperature for 18 - 20 hours. The reaction was transferred to a separatory funnel containing a saturated sodium bicarbonate solution (15 mL), then diluted with ethyl acetate (15 mL) and shaken vigorously. The resulting organic layer was separated, washed with brine (1 x 20 mL), dried over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* to afford a yellow residue (530 mg). The residue was purified via flash chromatography (2 % methanol / methylene chloride) to yield *cis*-2-methyl-1-(pyridine-4-carbonyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester as a white solid (420 mg, 93%).

[00263] To a solution of *N*-ethyl-4-chloroaniline (650 mg, 4.18 mmol) in anhydrous toluene at 10 °C was slowly added a 2M solution of trimethylaluminium in hexanes (2.1 mL, 4.18 mmol). The reaction mixture was stirred at room temperature until gas evolution stopped. A second round bottom flask was charged with *cis*-2-methyl-1-(pyridine-4-carbonyl)-1,2,3,4-tetrahydro-quinoline-4-carboxylic acid methyl ester (370 mg, 1.19 mmol) and the preformed aluminum amide was added. The resulting reaction mixture was refluxed for 20 hours. The reaction was concentrated, quenched with 1M aqueous hydrochloric acid at 0 °C (exothermic!), basified with 1M aqueous sodium hydroxide, and extracted with ethyl acetate. The resulting organic layer was separated, washed with brine, dried over magnesium sulfate, and filtered. The filtrate was concentrated *in vacuo* to afford an orange oil which was purified via flash chromatography (1% methanol / methylene chloride) followed by HPLC to provide (±)-*trans*-2-methyl-1-(pyridine-4-carbonyl)-1,2,3,4-tetrahydro-quinoline-4-

The aqueous layer was separated and the organic layer was washed with brine, dried over magnesium sulfate, filtered and concentrated to give a dark brown solid. The crude product was purified by silica gel chromatography (methylene chloride/methanol: 98/2 → 96/4 gradient) to provide 4-(4-methoxycarbonyl-4-methyl-pent-1-enyl)-benzoic acid as a light brown solid (915 mg, 50 %).

[00298] 4-(4-Methoxycarbonyl-4-methyl-pent-1-enyl)-benzoic acid (900 mg, 3.4 mmol, 1 eq.) was dissolved in ethanol (13 ml) and triethylamine (568 μ l, 4.1 mmol, 1.2 eq.) and palladium on carbon (90 mg, 10 % Pd/C) were then added. The mixture was stirred under hydrogen atmosphere for 20 h. Reaction mixture was filtered over celite and washed with ethanol. The filtrate was evaporated to yield a yellow oil. This oil was dissolved in ethyl acetate and washed with a 1N aqueous hydrochloric acid solution. The aqueous layer was removed and the organic layer was washed with water, and brine, then dried over magnesium sulfate, filtered and concentrated to give 4-(4-methoxycarbonyl-4-methyl-pentyl)-benzoic acid (763 mg, 85 %).

[00299] 4-(4-Methoxycarbonyl-4-methyl-pentyl)-benzoic acid (763 mg, 2.9 mmol, 1 eq.) was dissolved in methylene chloride (9 ml) and the solution was cooled down to 0°C. A 2 M solution of oxalyl chloride in methylene chloride (2.9 ml, 5.8 mmol, 2.0 eq.) was added followed by a catalytic amount of dimethylformamide. The reaction mixture was stirred at rt for 1 h, then concentrated to give the acid chloride as an oil. Methyl 5-[4-(chlorocarbonyl)phenyl]-2,2-dimethylpentanoate was used without further purification in subsequent steps.

[00300] Step 2. ($\pm$)-*trans*-Methyl 5-(4-{[4-{[(4-chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoate.

[00301] ($\pm$)-*trans*-Methyl 5-(4-{[4-{[(4-chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoate was made following general procedure A, substituting methyl 5-[4-(chlorocarbonyl)phenyl]-2,2-dimethylpentanoate for 4-trifluoromethyl-benzoyl chloride. Purification via silica gel chromatography (0-40% ethyl acetate / hexane gradient) yielded ($\pm$)-*trans*-methyl 5-(4-{[4-{[(4-chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoate. MS m/z: 575 (M+1).

[00302] Step 3. ($\pm$)-*trans*-5-(4-{[4-{[(4-Chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid.

[00303] To a solution of ($\pm$)-*trans*-methyl 5-(4-{[4-{[(4-chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoate (500 mg, 0.87 mmol) in 1:1 THF / methanol (5.0 mL) was added a solution of sodium hydroxide (69.5 mg, 1.74 mmol) in water (1.0 mL). The resulting mixture was heated at 60 °C for 18-20 hours and concentrated. The resulting residue was dissolved in water (~ 50 mL), cooled to 0 °C, and the solution acidified using

3N hydrochloric acid. The resulting precipitated material was collected via suction filtration, washed with 1N hydrochloric acid (3 x 25 mL), and dried to afford crude 5-(4-{[4-{[(4-Chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid as a mixture of *cis* and *trans* isomers. Purification via HPLC yielded (±)-*trans*-5-(4-{[4-{[(4-Chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid (23%).

[00304] Step 4. *rel*-(2*S*,4*S*)-(4-{[4-{[(4-Chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid and *rel*-(2*R*,4*R*)-(4-{[4-{[(4-chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid.

[00305] *rel*-(2*S*,4*S*)-(4-{[4-{[(4-Chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid and *rel*-(2*R*,4*R*)-(4-{[4-{[(4-chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid were isolated from (±)-*trans*-5-(4-{[4-{[(4-Chlorophenyl)(ethyl)amino]carbonyl}-2-methyl-3,4-dihydroquinolin-1(2H)-yl]carbonyl}phenyl)-2,2-dimethylpentanoic acid by preparative chiral HPLC. Data for single enantiomer (identical to enantiomer and to racemate), absolute stereochemistry unknown: ¹H-NMR (CD₃Cl) δ: 0.95 (d, 3H), 1.12 (t, 3H), 1.14 (s, 6H), 1.30 - 1.43 (m, 1H), 1.45 - 1.59 (m, 4H), 1.67 - 1.77 (m, 1H), 2.47 - 2.63 (m, 2H), 3.58 - 3.74 (m, 1H), 3.76 - 3.92 (m, 2H), 5.01 - 5.16 (m, 1H), 6.40 - 6.50 (m, 1H), 6.70 - 6.81 (m, 2H), 6.84 - 6.94 (m, 1H), 6.99 - 7.08 (m, 2H), 7.17 - 7.21 (m, 2H), 7.40 - 7.52 (m, 4H). [00307] Biological Testing

[00308] This radioligand membrane binding assay evaluates the ability of compounds to inhibit [³H] Prostaglandin D₂ (PGD₂) binding to the cloned human CRTH2 receptor stably expressed in HEK-293 cells (expressing human CRTh2 receptor and α subunit or the heterotrimeric G protein 16 were prepared by Biosignal Company) using Scintillation Proximity Assay.

[00309] A binding buffer containing 50mM Tris-HCl (pH 7.5), 5mM MgCl₂ and 1mM EDTA is prepared immediately prior to performing the assay. A bead/membrane solution at twice the final assay concentration comprising membranes (membranes bought from Biosignal) from the HEK-293 cells cloned to express CRTH2 receptor bound to and [³H] PGD₂ at two times the final assay concentration are prepared and stored on ice before adding to wells. Cold PGD₂ at twenty times the final assay concentration is prepared and stored on ice before adding to wells defining non-specific binding (NSB) corning plates #3653 are used for this assay.

[00310] 10 mM stock concentrations of compounds in 100% DMSO are prepared and stored at room temperature. A 10 point concentration response curve is then constructed for each compound, starting at 10 μ M (final assay concentration). The compounds are prepared at 40 times final assay concentrations with nine consequent-3-fold dilutions.

[00311] 0.1 μ l of each concentration of compound are added to the appropriate well of the 384 plate and 2 μ l of cold PGD₂ is added into the wells defining NSB. 20 μ l of [³H] PGD₂ and then 20 μ l of 2x of bead/membrane solution are then added to each well.

[00312] The plates are allowed to incubate at room temperature for approximately 2 hours and then counted on Packard Topcount using SPA tritium protocol for 1 minute / well.

[00313] The percent inhibition of PGD₂ binding (PGD₂ used at the K_D value or lower) to the HEK-293 cell membranes is determined, the assay is always run as duplicate for n=1 for a total of n=2 and shown below.

[00314] Compounds 1, 3, 6, 7, 9, 12, 13, 17-20, 22, 24-27, 30-32, 34, 36, 37, 40, 42, 45, 47, 48, 51, 55, 56, 58, 62-65, 67, 70, 72, 75, 77-78, 81-84 have K_i <1 μ M.

[00315] Compounds 2, 5, 11, 15, 33, 35, 50, 57, 61, 76 have K_i <10 μ M.

[00316] While this invention has been particularly shown and described with references to preferred embodiments thereof, it will be understood by those skilled in the art that various changes in form and details may be made therein without departing from the scope of the invention encompassed by the appended claims.
