

ABSTRACT

Provided are a connection management method for a remote user equipment, and a user equipment and a network-side device, which belong to the technical field of communications. The connection management method for the remote user equipment comprises: sending a first relay request to a network-side device, wherein the first relay request is used for requesting the network-side device to perform configurations related to a relay function; and receiving first configuration information sent by the network-side device, wherein the first configuration information comprises configuration information of a first Uu RLC bearer, with the first Uu RLC bearer being used for transmitting Uu signaling of the remote user equipment.
