

ABSTRACT

CORNER GUIDE AND FITTING

A corner guide includes a case, a flexible strip member, and a cover member. The case includes a pair of guiding parts each extending along longitudinal direction of each of the frames, a guiding path provided in the respective guiding parts, and an arc-shape linkage path connecting guiding paths. The flexible strip member is slidably disposed along the guiding paths and the linkage path. The cover member is attached to the linkage path and the guiding path provided in the other guiding part to restrict out-of-plane movement of the strip member. The linkage path and the guiding path provided in the other guiding part are opened through a region of the case opposing a depth face of the frame and have dimension allowing out-of-plane movement of the strip member.
