ABSTRACT

A history log of each of various applications, content, and services is analyzed to calculate a fee for a vendor according to a use record. A portal system 1 is connected with servers 2A, 2B, and 2C of a plurality of vendors and a client terminal 3 of a user via a network 4. A record collection system 41 includes a log reception unit 80, a log conversion unit 81, a log type analysis unit 82, a weighting unit 83, and a use record storage unit 84. Each use log stored in a log storage unit 8A in a DB 8 of each vendor is transmitted to the log reception unit 80. After the log conversion unit 81 standardizes the log, the weighting unit 83 quantifies the use record as points, and stores the points in a use record information DB 23.
