STOCK EXCHANGE TRADING PLATFORM

Abstract

The invention relates to a stock exchange trading platform for a plurality of trader data processing devices that are in communication connection with the trading platform, wherein the trading platform has a trading platform data processing device ("matcher"), which is able to store orders generated by one of the trader data processing devices in an order book, or to fill a matching order that is already recorded in the order book, at least partially, to acknowledge such received orders to the dispatching trader data processing device, and furthermore, to send messages to a plurality of connected trader data processing devices (in the case of a trading system with equally entitled traders, to everybody) in a broadcast mode. The trading platform is in particular characterized in that a unit of the trading data processing device controlling the optional execution or storing of the orders is configured as a dedicated logic circuit.
