

ARYL HYDROCARBON RECEPTOR AGONISTS AND USES THEREOF

CROSS-REFERENCE TO RELATED APPLICATION

[0001] The present application claims priority to U.S. provisional patent application No. 63/306,458 filed on February 03, 2022, the disclosure and content of which is incorporated herein by reference in its entirety for all purposes

FIELD OF THE INVENTION

[0002] The field of this invention is compounds, pharmaceutical compositions and methods of making and using them, especially as they are related to compounds and compositions that act as agonists of aryl hydrocarbon receptor (AhR). In particular, it relates to methods of using such agonists for treatment of neurodegenerative diseases and inflammatory disorders, especially those occurring in the intestinal tract or in relationship to the gut-brain axis. Particular conditions for which the compounds, compositions and methods of the invention are suited include ulcerative colitis, Crohn's disease, inflammatory bowel disease (IBD), multiple sclerosis, and Huntington's disease.

BACKGROUND OF THE INVENTION

[0003] Aryl hydrocarbon receptor (AhR) was long studied for its role in toxicity of exogenous substances such as TCDD (2,3,7,8-tetrachlorodibenzo-p-dioxin), which binds to AhR and causes it to activate endogenous detoxification mechanisms. However, AhR also recognizes a variety of endogenous ligands, many based on indoles and tryptophan analogs, and the evolutionary conservation, tight regulation, and widespread expression of AhR in the immune system strongly suggested it had important physiological functions. *The Aryl Hydrocarbon Receptor: Multitasking in the Immune System*, B. Stockinger, et al., Annu. Rev. Immunol. **2014**, 32:403–32. Its immune modulation effects have been the subject of extensive study, which demonstrated that AhR agonists affect model systems of experimental autoimmune encephalitis (EAE), graft-versus-host disease (GVHD), and mouse models of allergy and transplant tolerance, and also promotes regulatory T-cell proliferation and inflammatory cytokine secretion.

[0004] AhR is normally found in the cytosol, bound to actin filaments along with several chaperone proteins in an inactive complex. When a ligand binds to the actin complex, AhR dissociates from actin and translocates into the nucleus of the cell, where it is released from the chaperone complex. AhR then binds to a partner protein, ARNT (aryl hydrocarbon receptor nuclear translocator), forming a heterodimer. The heterodimer binds to a recognition motif, the dioxin response element (DRE), which induces expression of key proteins, including CYP1A1, CYP1A2, CYP1B1, and AhR repressor (AhRR), as well as affecting various adaptive immune system components.

[0005] AhR exerts multiple functions in the gut, acting as an essential keeper of the gut barrier. Dietary-derived AhR ligands ensure maintenance of intraepithelial lymphocytes (IELs) (e.g., $\gamma\delta$ T cells and CD8 $\alpha\alpha$ T cells) as well as innate lymphoid cells (ILCs) (e.g., ILC3) and proliferation of colonic crypt stem cells. Moreover, AhR signaling is critically involved in the formation of tertiary lymphoid tissues such as cryptopatches and intestinal lymphoid follicles (ILFs). AhR deficiency leads to loss of ILC3 and IELs, loss of IL-22, disruption of colonic crypt stem cell proliferation, and dysregulation of intestinal bacteria. These studies have shown that AhR plays an essential physiological role in preserving the homeostasis of intestinal barrier functions of the gut when activated by dietary components that act as agonists of AhR.

[0006] Agonists of AhR, including VAF347 and laquinimod, have demonstrated promising activity on immunological and neurodegenerative disorders. Laquinimod (TV-5600, previously ABR-215062) is a novel synthetic compound with high oral bioavailability, which was tested as an oral formulation for Crohn's disease (CD), multiple sclerosis (MS), Huntington's disease and lupus nephritis. Preclinical data in various experimental models of colitis and MS suggest that laquinimod has a direct inhibitory effect on antigen presenting cells and T cells, resulting in downregulation of pro-inflammatory cytokines. *A Phase II Study of Laquinimod in Crohn's Disease*, D'Haens G, et al. *Gut* 2015, vol. 64:1227–1235. It failed to meet the Phase 3 clinical trial objectives for treating MS, but demonstrated significant effects on brain atrophy in both relapsing-remitting multiple sclerosis and Huntington's disease patients, which supports the potential of AhR as a target site for treatment of neurodegenerative diseases.

Laquinimod

[0007] Without being bound by theory, compounds of the invention are believed to be effective for treating inflammatory and/or immune disorders that occur in the lower gastrointestinal (GI) tract by activating AhR in tissues of the lower GI tract. By activating AhR in tissues of the lower GI tract, compounds of the invention may also provide therapeutic effects in certain neuroinflammatory or neurodegenerative diseases through modulation of the gut-brain axis, the bidirectional communication between the GI system and the CNS.

[0008] Certain of the compounds of the invention comprise an arylamine group (Ar-NH_2), and known compounds having this feature that are used to treat similar conditions in the lower GI tract are sometimes administered as azo compounds of the general formula Ar-N=N-Ar' . Bacteria in the gut reduce the azo linkage to produce aryl amines, e.g., $\text{Ar-N=N-Ar'} \rightarrow \text{Ar-NH}_2 + \text{Ar'-NH}_2$. For example, sulfasalazine is used to treat ulcerative colitis and Crohn's disease, acting as an anti-inflammatory in the colon. It contains an azo linkage that gets reduced in the colon by gut bacteria, producing a sulfapyridine compound and 5-ASA as shown below. Sulfasalazine is thus a prodrug: its reduction in the colon releases 5-ASA, which focuses the drug's anti-inflammatory effects in the colon. *Br. J. Clin. Pharmac.* (1982), 13, 523-528.

[0009] Similarly, some compounds of the invention comprise an azo linkage of the general formula Ar-N=N-Ar' , which can be reduced in the colon to produce active AhR agonists that comprise a group of the formula Ar-NH_2 . These compounds are especially useful for oral administration to treat disorders of the colon or associated with the gut-brain axis. Note that azo compounds can exist as cis and trans isomers: as used herein, unless expressly described as a cis

or trans isomer, structural depictions of azo compounds of the invention include both cis and trans isomers as well as mixtures thereof.

[0010] While at least one topical AhR agonist (tapinarof) is in development for treatment of psoriasis and atopic dermatitis there remains a need for agonists of AhR useful to treat neurodegenerative and inflammatory disorders, including inflammatory bowel disorder, ulcerative colitis, Crohn's disease, multiple sclerosis, or Huntington's disease. The invention provides such compounds, including some azo compounds that act as prodrugs to target delivery of the active moiety to the lower GI tract.

Where a substituent group contains two R^a or R^b groups on the same or adjacent atoms (*e.g.*, $-\text{NR}^b_2$, or $-\text{NR}^b-\text{C}(\text{O})\text{R}^b$), the two R^a or R^b groups can optionally be taken together with the atoms in the substituent group to which are attached to form a ring having 5-8 ring members, which can be substituted as allowed for the R^a or R^b itself, and can contain an additional heteroatom (N, O or S) as a ring member.

[0028] The term “alkenyl” as used herein refers to an alkyl as defined above having at least two carbon atoms and at least one carbon-carbon double bond. Where applicable, the salt is a pharmaceutically acceptable salt, although this is not required for salts of intermediate compounds that are not intended for administration to a patient. By way of example, salts of the present compounds include those wherein the compound is protonated by an inorganic or organic acid to form a cation, with the conjugate base of the inorganic or organic acid as the anionic component of the salt.

ordinary skill of the art to modify the route of administration and dosage regimen of a particular compound in order to manage the pharmacokinetics of the present compounds for maximum beneficial effect in a patient.

Drug combinations

[0068] The methods of the embodiments comprise administering an effective amount of at least one exemplary compound of the present disclosure; optionally the compound may be administered in combination with one or more additional therapeutic agents, particularly therapeutic agents known to be useful for treating inflammatory bowel disorder, ulcerative colitis, Crohn's disease, multiple sclerosis, or Huntington's disease. An additional therapeutic agent is considered to be used in combination with a compound of the invention when timing of administration of the two agents allow them to act concurrently in the subject.

[0069] Examples of suitable additional therapeutic agents include prednisone and other steroids, 5-aminosalicylates such as mesalamine, immunomodulators including azathioprine, mercaptopurine, and methotrexate, and certain biologics including infliximab, adalimumab, and certolizumab pegol.

The additional active ingredients may be administered simultaneously with, prior to, or after administration of at least one exemplary compound of the present disclosure. Selection of suitable additional therapeutic agents and appropriate routes of administration is within the ordinary skill in the art.

Methods of using the exemplary compounds and pharmaceutical compositions thereof

[0071] To practice the method of the present invention, compounds of the invention and pharmaceutical compositions thereof may be administered orally, parenterally, by inhalation, topically, rectally, nasally, buccally, vaginally, via an implanted reservoir, or other drug administration methods. The term "parenteral" as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intraarterial, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

[0072] A sterile injectable composition, such as a sterile injectable aqueous or oleaginous suspension, may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent. Among the acceptable vehicles and solvents that may be employed include mannitol, water, Ringer's solution and isotonic sodium chloride solution. Suitable carriers and other pharmaceutical composition components are typically sterile.

[0073] In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium (*e.g.*, synthetic mono- or diglycerides). Fatty acids, such as oleic acid and its glyceride derivatives, are useful in the preparation of injectables, as are pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions can also contain a long-chain alcohol diluent or dispersant, or carboxymethyl cellulose or similar dispersing agents. Various emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms can also be used for the purpose of formulation.

[0074] In some embodiments, the compounds and compositions of the invention are formulated for oral administration. A composition for oral administration may be any orally acceptable dosage form including, but not limited to, tablets, capsules, emulsions and aqueous suspensions, dispersions and solutions. In the case of tablets for oral use, commonly used carriers include lactose and corn starch. Lubricating agents, such as magnesium stearate, can also be added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions or emulsions are administered orally, the active ingredient can be suspended or dissolved in an oily phase combined with emulsifying or suspending agents. If needed, certain sweetening, flavoring, or coloring agents can be added. A nasal aerosol or inhalation compositions can be prepared according to techniques well-known in the art of pharmaceutical formulation and can be prepared as solutions in, for example saline, employing suitable preservatives (for example, benzyl alcohol), absorption promoters to enhance bioavailability, and/or other solubilizing or dispersing agents known in the art.

[0075] In a preferred embodiment, the compounds of the invention are prepared for oral administration and are administered orally. This is particularly preferred for compounds of the invention wherein Z^1 or Z^2 is an azo-linked aryl group ($-N=N-Ar$).

[0076] In addition, the compounds having formula I or any of the compounds of Examples 1-58, may be administered alone or in combination with other therapeutic agents, *e.g.*, therapeutic agent useful to treat disorder, ulcerative colitis, Crohn's disease, multiple sclerosis, or Huntington's disease. Combination therapies according to the present invention comprise the administration of at least one exemplary compound of the present disclosure and at least one other pharmaceutically active ingredient. General Synthetic Procedures

[0078] Compounds of the present invention are readily prepared from commonly available compounds using procedures known to those skilled in the art, in view of the examples and Schemes provided herein.

Scheme 1.

[0079] Compounds of Formula (I) with Z² being NH₂ can be prepared according to Scheme 1. 1. Suzuki coupling of compound A and boronic acid/ester B gives the intermediate C.

Amination of **C** with substituted aniline **D** produced the intermediate **E**, and R^3 was transformed to amine to give the final product **F**. The R^3 group could be NO_2 , protected NH_2 or halogen, which can be transformed to free NH_2 by reduction, deprotection or amination, respectively. R^1 may be also further transformed to a different substitution group. Depending on the choice of R^1 and R^2 , the product can be a compound of Formula (I) or a precursor to such compounds.

Scheme 2.

[0080] The intermediate **E** can also be prepared according to Scheme 2. Treatment of compound **G** with DMF-DMA will give the intermediate **H**. Substituted aniline **D** can be transformed to substituted guanidine **I**. Condensation of **H** and **I** forms a pyrimidine ring and gives the intermediate **E**.

Scheme 3.

[0081] Similar to the route described in Scheme 1, compounds of Formula (I) with Z¹ being NH₂ can also be prepared according to Scheme 3. In some cases, one of R² or R³ is NH₂, in which case the conversion of compound **M** to compound **N** is not necessary.

Scheme 4.

[0082] Compounds of Formula (I) with Z¹ or Z² being -N=N-Ar can be prepared according to Scheme 4. The aniline compound **F** or **N** from the preceding Schemes can be transformed to diazonium intermediate **O** *in situ* by treatment with NaNO₂/HCl, which reacts with nucleophilic Ar to form azo compound **P**. Depending on the choice of R¹ and R², the product can be a compound of Formula (I) or a precursor to such compounds.

Scheme 5.

[0083] The final product **P** can also be prepared by reacting aniline product **F** or **N** with aryl nitroso **R**, which can be prepared by oxidation of arylamine **Q** with Oxone (Scheme 5). Depending on the choice of R^1 and R^2 , the product can be a compound of Formula (I) or a precursor to such compounds.

Scheme 6.

The aniline compound **F** or **N** can be transformed to nitroso- intermediate **S** by treatment with Oxone, then further converted to azo compound **P** by treatment with an aryl amine (Scheme 6). Depending on the choice of R^1 and R^2 , the product can be a compound of Formula (I) or a precursor to such compounds.

[0084] Using these and known alternative starting materials, the skilled person can prepare a wide variety of compounds of Formula (I).

Example 1: 4-(4-aminophenyl)-N-(4-(trifluoromethyl)phenyl)pyrimidin-2-amine

[0085] Step 1: 2-chloro-4-(4-nitrophenyl)pyrimidine

[0086] A mixture of (4-nitrophenyl)boronic acid (2.0 g, 11.98 mmol, 1.0 eq), 2,4-dichloropyrimidine (1.78 g, 11.98 mmol, 1.0 eq), Na₂CO₃ (2.54 g, 23.96 mmol, 2.0 eq) and PdCl₂(dppf) (854 mg, 1.2 mmol, 0.1 eq) in dioxane/H₂O (40 mL/4 mL) was stirred at 90 °C for 16 h under Ar. The reaction was monitored by LC-MS. The mixture was diluted with DCM/H₂O, and the organic phase was separated, dried over Na₂SO₄, filtered and concentrated.

The residue was purified by flash chromatography on silica gel (eluent: PE/EA = 4:1) to give the title compound (1.7 g, 60%) as a yellow solid. LC-MS: $[M+H]^+$ (m/z) = 236.1.

[0087] Step 2: 4-(4-nitrophenyl)-N-(4-(trifluoromethyl)phenyl)pyrimidin-2-amine

[0088] A mixture of 2-chloro-4-(4-nitrophenyl)pyrimidine (200 mg, 0.85 mmol, 1.0 eq), 4-(trifluoromethyl)aniline (150 mg, 0.93 mmol, 1.1 eq), $Pd(OAc)_2$ (19 mg, 0.085 mmol, 0.1 mmol), Xantphos (49 mg, 0.085 mmol, 0.1 eq) and Cs_2CO_3 (552 mg, 1.7 mmol, 2.0 eq) in dioxane (3.0 mL) was stirred at 110 °C for 16 h under Ar. The reaction was monitored by LC-MS. The mixture was partitioned between DCM/water. The organic phase was separated, dried over Na_2SO_4 , filtered and concentrated to give the title compound, which was used directly in the next step without further purification. LC-MS: $[M-H]^-$ (m/z) = 359.1.

[0089] Step 3: 4-(4-aminophenyl)-N-(4-(trifluoromethyl)phenyl)pyrimidin-2-amine

[00283] HT29-Lucia AhR cells were purchased from Invivogen (cat# ht21-ahr). HT29-AhR cells were propagated once in growth medium (DMEM, 10% FBS (30min at 56 °C), 100 U/ml penicillin, 100 µg/ml streptomycin, 100 µg/ml Normocin™ and 100 µg/ml Zeocin™) at 37 °C in an atmosphere of 5% CO₂. The cell suspension was removed from growth medium and rinsed gently with pre-warmed PBS (10 mL). Pre-warmed Trypsin (1 mL) was added, and cells were held at 30 °C for about 5 min and then detached by pipette. The dissociated cell clumps were gently pipetted up and down. The cells were resuspended in pre-warmed detection medium (DMEM, 10% FBS (30 min at 56°C), 100 U/ml penicillin, 100 µg/ml streptomycin, and test article or vehicle) and counted. A cell suspension of ~500,000 cells/mL in Detection medium was prepared.

[00284] The cells were plated into a 96-well plate at a density of 50,000 cells/well and incubated at 37 °C for 18-24h in an atmosphere of 5% CO₂. Samples (20 µL/well) were pipetted into a 96-well white (opaque), and QUANTI-Luc™ (50 µL/well) was added. The plate was gently tapped and then read in a luminometer (0.1s reading time). The data was analyzed, and EC50 curves and values were generated using GraphPad Prism 6.02 software.

$$\% \text{ efficacy} = 100\% * (\text{TA} - \text{BG}) / (\text{Ref} - \text{BG})$$

TA is the luminescent readout of test article.

BG is the background readout of DMSO vehicle, and

Ref is the readout of reference compound, which is VAF347.

EC50: the concentration to reach half of maximum efficacy of reference compound (VAF347).

Biological data 2: Stability in human feces

[00285] Azo compounds are not expected to exhibit AhR agonist activity until reduction occurs, which is mediated by gut bacteria. Accordingly, selected azo compounds of the invention were exposed to human feces under conditions suitable to promote azo reduction. Efficient reduction is expected to provide delivery of active moiety in the gut.

[00286] The human feces from two donors were homogenized in isotonic phosphate buffered saline (pH 6.8) with a ratio of 1:10 (w/v). The tubes were sealed using sealing film. Test article was dissolved in isotonic phosphate buffer (pH 6.8) to form a working solution of 20 μM (if the solubility allows). An aliquot of working solution (50 μL) was added to the human feces

homogenate (50 μ L) for each time point (0, 1, 2, 4, 6 and 24 h) in duplicate and placed under nitrogen for about 1 minute in order to exhaust air, and then incubated at 37 °C. After incubation at each pre-set time point, 1000 μ L acetonitrile containing internal standard was added to each tube to quench reaction. Samples were vortexed and centrifuged at 3700 rpm for 10 min and the supernatant was transferred for analysis (and diluted where necessary). The concentrations of test article and its metabolite (example 3) in the supernatants were determined using LC-MS/MS method. Sulfasalazine was used as a positive control. All incubations were performed in duplicate.
