(54) Title: A SCALABLE SEARCH SYSTEM USING HUMAN SEARCHERS

(57) Abstract: A system that allows a query to be submitted to a query distribution server that locates a human searcher who can perform a search on the query. The searcher performs a search using conventional search tools, such as a computer browser, and provides the results to the user through the system. A searcher who produces a search accepted by the user is rewarded. The results linked to the query can be stored in a database for later use when a similar query is submitted by another user. The searcher is located by comparing keywords of the query to keywords for which the searcher has registered to do searches. The searcher chosen by the system is one that ranks well in the keywords of the query that match to keywords registered by the searcher, prior successful searching by the searcher, speed of producing search results, and other factors that help to provide a quality search and experience for the user. While the search is being performed the user can be occupied by information provided to the user, such as videos, games, advertisements, etc. The information presented during the search can be based on keywords of the query and designated by the searcher who performs the search. The reward for the searchers can be based on revenue from advertisements.
