

DIMERIC COMPOUNDS

Field of the Invention

The present invention relates to dimeric compounds which act as inhibitors of SMAC protein binding to Inhibitor of Apoptosis Proteins (IAPs), and/or inhibitors of activated caspase protein binding to IAPs. These molecules are useful in the amelioration, treatment or control of cancer, especially solid tumors.

These compounds bind to the BIR2 or BIR2 and BIR3 regions of IAP proteins, including XIAP and cIAP, resulting in activation or reactivation of the caspase cascade and, as such, are useful for the treatment of proliferative diseases, including cancer.

Background of the Invention

Cancer is a disease of uncontrolled cell growth causing local expansion of a tumor and, potentially, distant metastases. One mechanism by which cancer cells grow is by avoidance of apoptosis, or programmed cell death. Alterations in apoptotic pathways have been linked to cancer cells being resistant to standard treatments, e.g., chemotherapeutics or radiation, and to the incidence and progression of cancer. See, e.g., E. Dean et al., "X-linked inhibitor of apoptosis protein as a therapeutic target," *Expert Opin. Ther. Targets* (2007) 11(11):1459-1471

The two basic pathways for apoptotic cell death are the intrinsic pathway and the extrinsic pathway. The intrinsic apoptotic pathway can be initiated by various mechanisms including cellular stress and drug-induced DNA damage. The extrinsic pathway can be initiated by activation of the death receptors by a chemokine. Initiation of either pathway results in the activation of a family of proteases called caspases. Once activated, the caspases can act to cleave a variety of substrates creating a cascade of events that lead to the activation of the effector caspases 3 and 7 and eventual cell death. The IAP family of proteins can bind to and inhibit the activity of caspases thus inhibiting apoptosis. See, e.g., Dean, *supra* at 1460.

The IAPs can contain up to three copies of homologous structural domains called baculoviral IAP repeat (BIR) domains, BIR1, BIR2 and BIR3. The BIR3 domain of the prototypical IAPs, cIAP and XIAP, can bind to and inhibit activated caspase 9. The BIR2 domain, in contrast, binds to and inhibits caspases 3 and 7. The proapoptotic protein Smac (also known as DIABLO) can block the BIR2 and BIR3 domains of IAPs competing with activated caspases resulting in release of the activated caspases from the IAPs and completion of the

apoptotic program. See, e.g., S. Wang, "Design of Small-Molecule Smac Mimetics as IAP Antagonists," Current Topics in Microbiology and Immunology 348, DOI 10.1007/82_2010_111, pp. 89-113.

Peptides and small molecules have been reported to bind to the BIR3 region of XIAP and cIAP, mimicking the action of Smac protein and releasing activated caspases. See, e.g., Dean, supra; and M. Gyrð-Hanse et al., "IAPs: From caspase inhibitors to modulators of NF-κB, inflammation and cancer," Nature Review/Cancer, August 2010, Vol 10:561-574.

Detailed Description of the Invention

Definitions

Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs.

As used herein, the following terms shall have the following definitions.

5 “Alkyl” means a monovalent linear or branched saturated hydrocarbon of 1 to 12 carbon atoms. In particular embodiments, alkyl has 1 to 6 carbon atoms, and in more particular embodiments 1 to 4 carbon atoms (C₁₋₄-alkyl). As used herein, “lower alkyl” denotes an alkyl group having from 1-6 carbon atoms (C₁₋₆-alkyl). The term “C₁₋₆-alkyl” is used alone or in combination with other terms. Examples of alkyl include methyl, ethyl, propyl, isopropyl, butyl
10 (also known as n-butyl), iso-butyl, sec-butyl, tert-butyl, pentyl, hexyl, and the like. The alkyl group can be optionally enriched in deuterium, e.g., -CD₃, -CD₂CD₃ and the like.

 “Aryl” means a monovalent aromatic carbocyclic mono-, bi- or tricyclic ring system comprising 6 to 19 carbon ring atoms. The term “aryl” is used alone or in combination with other terms. Examples of aryl moieties include, but are not limited to, phenyl, naphthyl (also known as
15 naphthalenyl), tolyl, xylyl, pyridinyl, quinolinyl, pyrimidinyl, imidazolyl, thiazolyl, anthracenyl, tetrazolyl, and fluorenyl. Particular aryl groups are phenyl and naphthyl.

 “Cyano” means -C≡N.

 “Cycloalkyl” means a substituted or unsubstituted stable monovalent saturated monocyclic, bicyclic or tricyclic system which consists of 3 to 10 ring carbon atoms. In
20 particular embodiments, cycloalkyl denotes a monovalent saturated monocyclic hydrocarbon group of 3 to 7 ring carbon atoms (“C₃₋₇-cycloalkyl”). The term “C₃₋₇-cycloalkyl” is used alone or in combination with other terms. Particular cycloalkyl groups are monocyclic. Examples for monocyclic cycloalkyl are cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl or cycloheptyl. Bicyclic means consisting of two saturated carbocycles having one or more carbon atoms in
25 common. Examples of bicyclic cycloalkyl include bicyclo[2.2.1]heptanyl, or bicyclo[2.2.2]octanyl. Tricyclic means consisting of three saturated carbocycles having two or more carbon atoms in common. Examples of tricyclic cycloalkyl include adamantane.

 “Fused” when referring to two or more rings, e.g. cycloalkyl fused with aryl, means that the rings have at least two atoms in common. An example of cycloalkyl fused with aryl is
30 tetrahydronaphthalene (also known as tetralin).

“Halogen” or “Halo” means an atom selected from F, Cl, Br or I. In particular embodiments Halogen means F and Cl.

“Heteroatom” means an atom selected from N, O or S.

“Heteroaryl” means a substituted or unsubstituted aromatic heterocyclic ring system containing up to two rings, at least one ring of which includes 1, 2, or 3 heteroatoms, the remaining ring atoms being carbon. Examples of heteroaryl groups include, but are not limited to, thienyl (also known as thiophenyl), furyl (also known as furanyl), indolyl, pyrrolyl, pyridinyl, pyrazinyl, oxazolyl, isoxazolyl, oxadiazolyl, thiazolyl, quinolinyl, isoquinolinyl, indazolyl, pyrimidinyl, imidazolyl, triazolyl, tetrazolyl, triazinyl, pyrazolyl, benzo[d]isoxazolyl, benzothiazolyl, 2-oxo-2H-chromen-4-yl, benzo[d]isoxazolyl, benzothiophenyl, benzoimidazolyl, naphthyridinyl and cinnolinyl. Particular heteroaryl groups are pyrazinyl and pyridinyl.

In the case of a heteroaryl that is bicyclic it should be understood that one ring may be aryl while the other is heteroaryl and both may be independently substituted or unsubstituted.

“IC₅₀” refers to the concentration of a particular compound required to inhibit 50% of a specific measured activity. IC₅₀ can be measured, *inter alia*, as is described subsequently in Example 29.

“Pharmaceutically acceptable,” such as pharmaceutically acceptable carrier, excipient, etc., means pharmacologically acceptable and substantially non-toxic to the subject to which the particular compound is administered.

“Pharmaceutically acceptable salt” refers to conventional acid-addition salts or base-addition salts that retain the biological effectiveness and properties of the compounds of the present invention and are formed from suitable non-toxic organic or inorganic acids or organic or inorganic bases. Sample acid-addition salts include those derived from inorganic acids such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, sulfamic acid, phosphoric acid and nitric acid, and those derived from organic acids such as p-toluenesulfonic acid, salicylic acid, methanesulfonic acid, oxalic acid, succinic acid, citric acid, malic acid, lactic acid, fumaric acid, trifluoroacetic acid and the like. Sample base-addition salts include those derived from ammonium, potassium, sodium and, quaternary ammonium hydroxides, such as for example, tetramethylammonium hydroxide. Chemical modification of a pharmaceutical compound (i.e. drug) into a salt is a technique well known to pharmaceutical chemists to obtain improved physical and chemical stability, hygroscopicity, flowability and solubility of

compounds. *See, e.g., Ansel et al., Pharmaceutical Dosage Forms and Drug Delivery Systems* (1995) at pgs. 456-457.

“Substituted,” as in substituted alkyl, aryl or heteroaryl means that the substitution (i.e. replacement of one hydrogen atom) can occur at one or more positions and, unless otherwise indicated, that the substituents at each substitution site are independently selected from the specified options. The term “optionally substituted” refers to the fact that one or more hydrogen atoms of a chemical group (with one or more hydrogen atoms) can be, but does not necessarily have to be, substituted with another substituent.

The definitions described herein apply irrespective of whether the terms in question appear alone or in combination. It is contemplated that the definitions described herein can be appended to form chemically-relevant combinations, such as e.g. “heterocycloalkylaryl”, “haloalkylheteroaryl”, “arylalkylheterocycloalkyl”, or “alkoxyalkyl”. The last member of the combination is the radical which is binding to the rest of the molecule. The other members of the combination are attached to the binding radical in reversed order in respect of the literal sequence, e.g. the combination arylalkylheterocycloalkyl refers to a heterocycloalkyl-radical which is substituted by an alkyl which is substituted by an aryl.

As used in this application, if a formula or group appears to be missing a substituent, that is it appears the valence is not complete, it is presumed the missing substituent is an H.

In the structural formulae presented herein a broken bond (a) denotes that the substituent is below the plane of the paper and a wedged bond (b) denotes that the substituent is above the plane of the paper.

or a pharmaceutically acceptable salt of any of the foregoing compounds.

The compounds of Formula I as well as their salts have at least one asymmetric carbon atom and therefore may be present as mixtures of different stereoisomers. The various isomers can be isolated by known separation methods, e.g., chromatography.

25 Compounds disclosed herein and covered by Formula I above may exhibit tautomerism or structural isomerism. It is intended that the invention encompasses any tautomeric or structural isomeric form of these compounds, or mixtures of such forms, and is not limited to any one tautomeric or structural isomeric form depicted in the formulas above.

Dosages

The compounds of the invention preferably bind to BIR domains of an IAP preventing the IAP from binding to other proteins. Examples of Bir binding proteins include, but are not limited to, caspase 3, caspase 7, caspase 9, Smac and the like. Examples of IAPs include, but are not limited to, XIAP, cIAP1, cIAP2 or NAIP. In one aspect, the compound of the invention bind to the BIR2 and/or BIR3 domains of XIAP, cIAP1and/or cIAP2. In another aspect, the compounds of the invention bind to the BIR2 domain of XIAP, cIAP1and/or cIAP2.

Compounds of the invention are useful for inducing apoptosis in cells or sensitizing cells to apoptotic signals, in particular cancer cells. Apoptotic signals can be induced in cancer cells by, e.g., radiation therapy or antineoplastic chemotherapy. Alternatively, apoptotic signals can be induced in cancer cells by activation of the death receptors by death receptor agonists. Death receptor agonists can be naturally occurring, e.g., tumor necrosis factor α , (TNF- α) or non-naturally occurring, e.g., a synthetic antibody such as a DR4 or DR5 antibody.

The compounds of the present invention are thus useful in the amelioration, control or treatment of cell proliferative disorders such as, in particular, oncological disorders. These compounds and formulations containing said compounds are anticipated to be useful in the treatment or control of blood cancers, such as, for example, acute myeloid leukemia, or solid tumors, such as, for example, breast, colon, lung and prostate tumors.

A “therapeutically effective amount” or “effective amount” of a compound in accordance with this invention means an amount of compound that is effective to prevent, alleviate or ameliorate symptoms of disease or prolong the survival of the subject being treated. Determination of a therapeutically effective amount is within the skill in the art.

The therapeutically effective amount or dosage of a compound according to this invention can vary within wide limits and may be determined in a manner known in the art. Such dosage will be adjusted to the individual requirements in each particular case including the specific compound(s) being administered, the route of administration, the condition being treated, as well as the patient being treated. In general, in the case of oral or parenteral administration to adult humans weighing approximately 70 Kg, a daily dosage of about 10 mg to about 10,000 mg, preferably from about 200 mg to about 1,000 mg, should be appropriate, although the upper limit may be exceeded when indicated. The daily dosage can be administered as a single dose or in divided doses, or for parenteral administration, it may be given as one or more bolus injections or as a continuous infusion.

Pharmaceutical preparations useful in the practice of the invention, i.e., comprising the compounds of the invention can be administered internally, such as orally (e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatin capsules, solutions, emulsions or suspensions), nasally (e.g. in the form of nasal sprays) or rectally (e.g. in the form of suppositories). However, the administration can also be effected parentally, such as intramuscularly or intravenously (e.g. in the form of injection solutions). Moreover, administration can be effected topically (e.g. in the form of ointments, creams or oils).

Compositions/Formulations

In an alternative embodiment, the present invention includes pharmaceutical compositions comprising at least one compound of Formula I, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable excipient and/or carrier.

These pharmaceutical compositions can be suitable for oral, nasal, topical (including buccal and sublingual), rectal, vaginal and/or parenteral administration. The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. The amount of active ingredient which can be combined with a carrier material to produce a single dosage form will vary depending upon the host being treated, as well as the particular mode of administration. The amount of active ingredient which can be combined with a carrier material to produce a single dosage form will generally be that amount of a Formula I compound which produces a therapeutic effect. Generally, out of one hundred percent, this amount will range from about 1 percent to about ninety-nine percent of active ingredient, preferably from about 5 percent to about 70 percent, most preferably from about 10 percent to about 30 percent.

Methods of preparing these formulations or compositions include the step of bringing into association a compound of the present invention with the carrier and, optionally, one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association a compound of the present invention with liquid carriers, or finely divided solid carriers, or both, and then, if necessary, shaping the product.

The compounds of Formula I and their pharmaceutically acceptable salts and esters can be processed with pharmaceutically inert, inorganic or organic adjuvants for the production of tablets, coated tablets, dragées and hard gelatin capsules. Lactose, polyvinylpyrrolidone, hydroxypropylmethylcellulose, hydroxypropylcellulose, microcrystalline cellulose, corn starch

or derivatives thereof, talc, stearic acid or its salts etc. can be used, for example, as such adjuvants for tablets, dragées and hard gelatin capsules.

Suitable adjuvants for soft gelatin capsules, are, for example, vegetable oils, waxes, fats, semi-solid substances and liquid polyols, etc. Suitable adjuvants for the production of solutions and syrups are, for example, H₂O, polyols, saccharose, invert sugar, glucose, etc. Suitable adjuvants for injection solutions are, for example, H₂O, alcohols, polyols, glycerol, vegetable oils, etc. Suitable adjuvants for suppositories are, for example, natural or hardened oils, waxes, fats, semi-solid or liquid polyols, etc. Suitable adjuvants for topical preparations are glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene glycols and cellulose derivatives.

Moreover, the pharmaceutical preparations can contain preservatives, solubilizers, viscosity-increasing substances, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavors, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain other therapeutic substances.

The compounds in the present invention (compounds of general Formula I) can be prepared using the general reaction scheme set out in the schemes below.

Scheme 1

A suitably protected 2-amino-3-aminopropionic acid of general formula 2 and a substituted or unsubstituted 1-fluoro-2-nitrobenzene of general formula 3 can be reacted with a base to give compounds of general formula 4. Compounds of general formula 4 can be reacted under reducing conditions to provide compounds of general formula 5. The reduction methods can include catalytic hydrogenation and chemical reduction. Compounds of general formula 5 can be subjected to dehydrating conditions to afford compounds of general formula 6. benzodiazepine-1-carbonyl]benzoyl]-4-oxo-2,3-dihydro-1,5-benzodiazepin-3-yl]carbamate (31 mg, 0.026 mmol) and acetyl chloride (9.3 μ L, 0.131 mmol) were combined in MeOH (2 mL) and stirred at room temperature for 16 h. The mixture was concentrated to give (3S)-3-amino-1-[4-[(3S)-3-amino-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-4-oxo-2,3-dihydro-1,5-benzodiazepine-1-carbonyl]benzoyl]-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-2,3-dihydro-1,5-benzodiazepin-4-one dihydrochloride as a white solid (27 mg, 98%) that was used without further purification.

Step 4: (3S)-3-Amino-1-[4-[(3S)-3-amino-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-4-oxo-2,3-dihydro-1,5-benzodiazepine-1-carbonyl]benzoyl]-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-2,3-dihydro-1,5-benzodiazepin-4-one dihydrochloride (27 mg, 0.026 mmol), Boc-N-Me-Ala-OH (10.9 mg, 0.0537 mmol), N,N-diisopropylethylamine (44.7 μ L, 0.256 mmol), and HATU (20.4 mg, 0.0537 mmol) were combined in CH₂Cl₂ (2 mL) and stirred at room temperature for 5 days. The mixture was partitioned between saturated ammonium chloride solution and dichloromethane. The organic layer was separated and washed with water, saturated sodium bicarbonate solution, brine and dried over anhydrous magnesium sulfate. Concentration gave an oil that was chromatographed over silica gel to give tert-butyl N-[(1S)-2-[[[(3S)-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-1-[4-[(3S)-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-3-[[[(2S)-2-[tert-butoxycarbonyl(methyl)amino]propanoyl]amino]-4-oxo-2,3-dihydro-1,5-benzodiazepine-1-carbonyl]benzoyl]-4-oxo-2,3-dihydro-1,5-benzodiazepin-3-yl]amino]-1-methyl-2-oxo-ethyl]-N-methyl-carbamate (24.5 mg, 71%) as an oil.

Step 5: tert-Butyl N-[(1S)-2-[[[(3S)-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-1-[4-[(3S)-5-[(6-bromo-2-methoxy-1-naphthyl)methyl]-3-[[[(2S)-2-[tert-butoxycarbonyl(methyl)amino]propanoyl]amino]-4-oxo-2,3-dihydro-1,5-benzodiazepine-1-carbonyl]benzoyl]-4-oxo-2,3-dihydro-1,5-benzodiazepin-3-yl]amino]-1-methyl-2-oxo-ethyl]-N-methyl-carbamate (24 mg, 0.018 mmol) and acetyl chloride (6.3 μ L, 0.089 mmol) were combined in MeOH (2 mL) and stirred at room temperature overnight. The mixture was concentrated and the residue triturated with acetonitrile to give the title compound (18.3 mg, 84%) as a solid. LC-MS: 1149 [M-H].

EXAMPLE 29

Biochemical Assays

TR-FRET Assay for BIR2 and BIR3

The ability of a test compound to inhibit the binding of BIR2 and/or BIR3 domains of the XIAP protein to Peptide A (a SMAC-derived peptide described below) evidences that the test compound acts as a SMAC-mimetic resulting in reactivation of a cell's apoptotic pathway.

5 The peptide AVPIAQKSEK-(ϵ -biotin)-OH 1:2 TFA ("Peptide A") was identified as a substrate for the TR-FRET assay by screening the 6x Histidine-tagged BIR2 domain and BIR3 domain of XIAP against a set of 29 peptides synthesized based on sequences reported by Sweeny et al. (*Biochemistry*, **2006**, 45, 14740-14748). The peptides were labeled with the fluorescent tags FITC or TAMRA and K_d values were determined by fluorescence polarization assay. The sequence AVPIAQKSEK was identified as optimal for using in an assay. The peptide sequence
10 was derivatized with biotin to provide AVPIAQKSEK-(ϵ -biotin)-OH 1:2 TFA as the substrate for the TR-FRET assay.

The XIAP protein sequence was obtained from the SWISS-PROT protein sequence database and the BIR2 and BIR3 domains were derived from that. The sequence of the BIR2 domain used for the TR-FRET assay is

Ten nanomolar of 6x Histidine-tagged BIR2 domain, corresponding to amino acids 124-240 of XIAP, or BIR3 domain, corresponding to amino acids 241-356 of XIAP, was mixed with 20 nM of the peptide AVPIAQKSEK-(ϵ -biotin)-OH 1:2 TFA, in the presence of 50 mM Tris-Cl, pH 7.5, 100 mM NaCl, 1 mM dithiothreitol (DTT) and 0.1 mg/mL bovine serum albumin (BSA).
25 Following a 45 min. incubation at 37 °C, Europium-Streptavidin and Allophycocyanin conjugated anti-Histidine antibody were added to a final concentration of 1.5 nM and 15 nM, respectively. Time-resolved fluorescence resonance energy transfer (TR-FRET) signals were measured 1 hour later at room temperature. Test compound potency was assessed at 10 serially
30 diluted concentrations. Percentage of inhibition at each concentration was determined to generate an IC₅₀ value for each test compound.

These values are listed below in Table 4.
