

AZAADAMANTANE DERIVATIVES AND METHODS OF USE

BACKGROUND OF THE INVENTION

Cross-Reference of Related Applications

5 This application claims the benefit of U.S. Provisional Patent Application Serial No. 60/856,992, filed November 6, 2006, and U.S. Provisional Patent Application Serial No. 60/908,143, filed March 26, 2007, each application of which is herein incorporated by reference in its entirety.

10 Technical Field

 The invention relates to azaadamantane derivatives, and more particularly ether- or amine-substituted azaadamantane derivatives, compositions comprising such compounds, methods of preventing or treating conditions and disorders using such compounds and compositions, processes for preparing such compounds, and
15 intermediates obtained during such processes.

Description of Related Technology

 Nicotinic acetylcholine receptors (nAChRs) are widely distributed throughout the central (CNS) and peripheral (PNS) nervous systems. Such receptors play an
20 important role in regulating CNS function, particularly by modulating release of a wide range of neurotransmitters, including, but not necessarily limited to, acetylcholine, norepinephrine, dopamine, serotonin, and GABA. Consequently, nicotinic receptors mediate a very wide range of physiological effects, and have been targeted for therapeutic treatment of disorders relating to cognitive function, learning
25 and memory, neurodegeneration, pain, inflammation, psychosis, sensory gating, mood, and emotion, among other conditions.

 Many subtypes of the nAChR exist in the CNS and periphery. Each subtype has a different effect on regulating the overall physiological function. Typically, nAChRs are ion channels that are constructed from a pentameric assembly of subunit

proteins. At least 12 subunit proteins, $\alpha 2$ - $\alpha 10$ and $\beta 2$ - $\beta 4$, have been identified in neuronal tissue. These subunits provide for a great variety of homomeric and heteromeric combinations that account for the diverse receptor subtypes. For example, the predominant receptor that is responsible for high affinity binding of nicotine in brain tissue has composition $(\alpha 4)_2(\beta 2)_3$ (the $\alpha 4\beta 2$ subtype), while another major population of receptors is comprised of homomeric $(\alpha 7)_5$ (the $\alpha 7$ subtype) receptors.

Certain compounds, like the plant alkaloid nicotine, interact with all subtypes of the nAChRs, accounting for the profound physiological effects of this compound. While nicotine has been demonstrated to have many beneficial properties, not all of the effects mediated by nicotine are desirable. For example, nicotine exerts gastrointestinal and cardiovascular side effects that interfere at therapeutic doses, and its addictive nature and acute toxicity are well-known. Ligands that are selective for interaction with only certain subtypes of the nAChR offer potential for achieving beneficial therapeutic effects with an improved margin for safety.

The $\alpha 7$ and $\alpha 4\beta 2$ nAChRs have been shown to play a significant role in enhancing cognitive function, including aspects of learning, memory and attention (Levin, E.D., J. Neurobiol. 53: 633-640, 2002). For example, $\alpha 7$ nAChRs have been linked to conditions and disorders related to attention deficit disorder, attention deficit hyperactivity disorder (ADHD), schizophrenia, Alzheimer's disease (AD), mild cognitive impairment, senile dementia, dementia associated with Lewy bodies, dementia associated with Down's syndrome, AIDS dementia, and Pick's disease, as well as inflammation. The $\alpha 4\beta 2$ receptor subtype is implicated in attention, cognition, epilepsy, and pain control (Paterson and Norberg, *Progress in Neurobiology* 61 75-111, 2000) as well as smoking cessation or nicotine withdrawal syndrome.

The activity at both $\alpha 7$ and $\alpha 4\beta 2$ nAChRs can be modified or regulated by the administration of subtype selective nAChR ligands. The ligands can exhibit antagonist, agonist, or partial agonist properties. Compounds that function as allosteric modulators are also known.

Although compounds that nonselectively demonstrate activity at a range of nicotinic receptor subtypes including the $\alpha 4\beta 2$ and $\alpha 7$ nAChRs are known, it would be beneficial to provide compounds that interact selectively with $\alpha 7$ -containing

neuronal nAChRs, $\alpha 4\beta 2$ nAChRs, or both $\alpha 7$ and $\alpha 4\beta 2$ nAChRs compared to other subtypes.

SUMMARY OF THE INVENTION

The invention is directed to azaadamantane derivatives, compositions
15 comprising such compounds, processes for preparing such compounds, and intermediates obtained during such processes. More particularly, the invention relates to ether- or amine-substituted azaadamantane compounds and related methods and processes thereof.

20 One aspect of the invention relates to a compound of formula (I)

(I);

or a pharmaceutically acceptable salt or prodrug thereof, wherein

- L₁ is -O- or -NR_a-;
- 25 A is -Ar₁, -Ar₂-L₂-Ar₃ or -Ar₄-L₃-Ar₅;
- Ar₁ is aryl or heteroaryl;
- Ar₂ is aryl or monocyclic heteroaryl;
- Ar₃ is aryl or heteroaryl;
- Ar₄ is a bicyclic heteroaryl;
- 30 Ar₅ is aryl or heteroaryl;
- L₂ is a bond, -O-, -NR_a-, -C(O)NR_a-, or -CH₂-;
- L₃ is a bond, -O-, -NR_a- or -CH₂-; and

R_a is hydrogen or alkyl.

Another aspect of the invention relates to pharmaceutical compositions comprising compounds of the invention. Such compositions can be administered in accordance with a method of the invention, typically as part of a therapeutic regimen for treatment or prevention of conditions and disorders related to nAChR activity, and more particularly $\alpha 7$ nAChR activity, $\alpha 4\beta 2$ nAChR activity, or both $\alpha 7$ nAChR activity and $\alpha 4\beta 2$ nAChR activity.

Yet another aspect of the invention relates to a method of modulating both $\alpha 7$ and $\alpha 4\beta 2$ nAChR activity. The method is useful for treating, preventing or both treating and preventing conditions and disorders related to both $\alpha 7$ and $\alpha 4\beta 2$ nAChR activity, particularly in mammals.

A further aspect of the invention relates to a method of selectively modulating nAChR activity, for example $\alpha 7$ nAChR activity. The method is useful for treating, preventing or both treating and preventing conditions and disorders related to $\alpha 7$ nAChR activity in mammals. A method of selectively modulating $\alpha 4\beta 2$ nAChR activity also is contemplated.

Such methods are useful for conditions and disorders related to attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), schizophrenia, mild cognitive impairment, age-associated memory impairment (AAMI), senile dementia, AIDS dementia, Pick's disease, dementia associated with Lewy bodies, dementia associated with Down's syndrome, schizophrenia, smoking cessation, nicotinic withdrawal syndrome, amyotrophic lateral sclerosis, Huntington's disease, diminished CNS function associated with traumatic brain injury, acute pain, post-surgical pain, chronic pain, inflammatory pain, neuropathic pain, infertility, lack of circulation, need for new blood vessel growth associated with wound healing, more particularly circulation around a vascular occlusion, need for new blood vessel growth associated with vascularization of skin grafts, ischemia, inflammation, sepsis, wound healing, and other complications associated with diabetes, among other systemic and neuroimmunomodulatory activities.

The invention also relates to particular salts of certain compounds of the invention as well as compositions comprising and processes for preparing such compounds and salts.

The compounds, including salts thereof, compositions comprising the

compounds, methods for using the compounds, and processes for preparing the compounds, as well as intermediates obtained in such processes, are further described herein.

5 DETAILED DESCRIPTION OF THE INVENTION

Definition of Terms

As used throughout this specification and the appended claims, the following terms have the following meanings:

10 The term "alkenyl" as used herein, means a straight or branched chain hydrocarbon containing from 2 to 10 carbons and containing at least one carbon-carbon double bond formed by the removal of two hydrogens. Representative examples of alkenyl include, but are not limited to, ethenyl, 2-propenyl, 2-methyl-2-propenyl, 3-butenyl, 4-pentenyl, 5-hexenyl, 2-heptenyl, 2-methyl-1-heptenyl, and 3-
15 decenyl.

The term "alkenylene" means a divalent group derived from a straight or branched chain hydrocarbon of from 2 to 10 carbon atoms containing at least one double bond. Representative examples of alkenylene include, but are not limited to, $-\text{CH}=\text{CH}-$, $-\text{CH}=\text{CH}_2\text{CH}_2-$, and $-\text{CH}=\text{C}(\text{CH}_3)\text{CH}_2-$.

20 The term "alkenyloxy" as used herein, means an alkenyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom. Representative examples of alkenyloxy include, but are not limited to, allyloxy, 2-butenyloxy and 3-butenyloxy.

The term "alkoxy" as used herein, means an alkyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom. Representative examples of alkoxy include, but are not limited to, methoxy, ethoxy, propoxy, 2-propoxy, butoxy, tert-butoxy, pentyloxy, and hexyloxy.

The term "alkoxyalkoxy" as used herein, means an alkoxy group, as defined herein, appended to the parent molecular moiety through another alkoxy group, as defined herein. Representative examples of alkoxyalkoxy include, but are not limited to, tert-butoxymethoxy, 2-ethoxyethoxy, 2-methoxyethoxy, and methoxymethoxy.

The term "alkoxyalkoxyalkyl" as used herein, means an alkoxyalkoxy group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkoxyalkoxyalkyl include, but are not

limited to, tert-butoxymethoxymethyl, ethoxymethoxymethyl, (2-methoxyethoxy)methyl, and 2-(2-methoxyethoxy)ethyl.

The term "alkoxyalkyl" as used herein, means an alkoxy group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkoxyalkyl include, but are not limited to, tert-butoxymethyl, 2-ethoxyethyl, 2-methoxyethyl, and methoxymethyl.

The term "alkoxycarbonyl" as used herein, means an alkoxy group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of alkoxycarbonyl include, but are not limited to, methoxycarbonyl, ethoxycarbonyl, and tert-butoxycarbonyl.

The term "alkoxycarbonylalkyl" as used herein, means an alkoxycarbonyl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkoxycarbonylalkyl include, but are not limited to, 3-methoxycarbonylpropyl, 4-ethoxycarbonylbutyl, and 2-tert-butoxycarbonylethyl.

The term "alkoxysulfonyl" as used herein, means an alkoxy group, as defined herein, appended to the parent molecular moiety through a sulfonyl group, as defined herein. Representative examples of alkoxysulfonyl include, but are not limited to, methoxysulfonyl, ethoxysulfonyl and propoxysulfonyl.

The term "alkyl" as used herein, means a straight or branched chain hydrocarbon containing from 1 to 10 carbon atoms. Representative examples of alkyl include, but are not limited to, methyl, ethyl, n-propyl, iso-propyl, n-butyl, sec-butyl, iso-butyl, tert-butyl, n-pentyl, isopentyl, neopentyl, n-hexyl, 3-methylhexyl, 2,2-dimethylpentyl, 2,3-dimethylpentyl, n-heptyl, n-octyl, n-nonyl, and n-decyl.

The term "alkylcarbonyl" as used herein, means an alkyl group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of alkylcarbonyl include, but are not limited to, acetyl, 1-oxopropyl, 2,2-dimethyl-1-oxopropyl, 1-oxobutyl, and 1-oxopentyl.

The term "alkylcarbonylalkyl" as used herein, means an alkylcarbonyl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkylcarbonylalkyl include, but are not limited to, 2-oxopropyl, 3,3-dimethyl-2-oxopropyl, 3-oxobutyl, and 3-oxopentyl.

The term "alkylcarbonyloxy" as used herein, means an alkylcarbonyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom.

Representative examples of alkylcarbonyloxy include, but are not limited to, acetyloxy, ethylcarbonyloxy, and tert-butylcarbonyloxy.

The term "alkylene" means a divalent group derived from a straight or branched chain hydrocarbon of from 1 to 10 carbon atoms. Representative examples
5 of alkylene include, but are not limited to, $-\text{CH}_2-$, $-\text{CH}(\text{CH}_3)-$, $-\text{C}(\text{CH}_3)_2-$, $-\text{CH}_2\text{CH}_2-$, $-\text{CH}_2\text{CH}_2\text{CH}_2-$, $-\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$, and $-\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2-$.

The term "alkylsulfinyl" as used herein, means an alkyl group, as defined herein, appended to the parent molecular moiety through a sulfinyl group, as defined herein. Representative examples of alkylsulfinyl include, but are not limited to,
10 methylsulfinyl and ethylsulfinyl.

The term "alkylsulfinylalkyl" as used herein, means an alkylsulfinyl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkylsulfinylalkyl include, but are not limited to, methylsulfinylmethyl and ethylsulfinylmethyl.

15 The term "alkylsulfonyl" as used herein, means an alkyl group, as defined herein, appended to the parent molecular moiety through a sulfonyl group, as defined herein. Representative examples of alkylsulfonyl include, but are not limited to, methylsulfonyl and ethylsulfonyl.

The term "alkylsulfonylalkyl" as used herein, means an alkylsulfonyl group, as
20 defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkylsulfonylalkyl include, but are not limited to, methylsulfonylmethyl and ethylsulfonylmethyl.

The term "alkylthio" as used herein, means an alkyl group, as defined herein, appended to the parent molecular moiety through a sulfur atom. Representative
25 examples of alkylthio include, but are not limited to, methylthio, ethylthio, tert-butylthio, and hexylthio.

The term "alkylthioalkyl" as used herein, means an alkylthio group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of alkylthioalkyl include, but are not limited to,
30 methylthiomethyl and 2-(ethylthio)ethyl.

The term "alkynyl" as used herein, means a straight or branched chain hydrocarbon group containing from 2 to 10 carbon atoms and containing at least one carbon-carbon triple bond. Representative examples of alkynyl include, but are not limited to, acetylenyl, 1-propynyl, 2-propynyl, 3-butyne, 2-pentyne, and 1-butyne.

The term "alkynylene" means a divalent group derived from a straight or branched chain hydrocarbon of from 2 to 10 carbon atoms containing at least one triple bond. Representative examples of alkynylene include, but are not limited to, $-C\equiv C-$, $-CH_2C\equiv C-$, $-CH(CH_3)CH_2C\equiv C-$, $-C\equiv CCH_2-$, and $-C\equiv CCH(CH_3)CH_2-$.

- 5 The term "alkynyloxy" as used herein, means an alkynyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom. Representative examples of alkynyloxy include, but are not limited to, 2-propynyloxy and 2-butyloxy.

- 10 The term "aryl," as used herein, means phenyl, a bicyclic aryl or a tricyclic aryl. The bicyclic aryl is naphthyl, a phenyl fused to a cycloalkyl, or a phenyl fused to a cycloalkenyl. Representative examples of the bicyclic aryl include, but are not limited to, dihydroindenyl, indenyl, naphthyl, dihydronaphthalenyl, and tetrahydronaphthalenyl. The tricyclic aryl is anthracene or phenanthrene, or a bicyclic aryl fused to a cycloalkyl, or a bicyclic aryl fused to a cycloalkenyl, or a bicyclic aryl
15 fused to a phenyl. Representative examples of tricyclic aryl ring include, but are not limited to, azulenyl, dihydroanthracenyl, fluorenyl, and tetrahydrophenanthrenyl.

- The aryl groups of this invention can be substituted with 1, 2, 3, 4 or 5 substituents independently selected from alkenyl, alkoxy, alkoxyalkoxy, alkoxyalkoxyalkyl, alkoxyalkyl, alkoxycarbonyl, alkoxycarbonylalkyl, alkyl,
20 alkylcarbonyl, alkylcarbonylalkyl, alkylcarbonyloxy, alkylsulfinyl, alkylsulfinylalkyl, alkylsulfonyl, alkylsulfonylalkyl, alkylthio, alkylthioalkyl, alkynyl, carboxy, carboxyalkyl, cyano, cyanoalkyl, formyl, formylalkyl, halogen, haloalkyl, hydroxy, hydroxyalkyl, mercapto, nitro, $-NZ_1Z_2$, and $(NZ_3Z_4)carbonyl$.

- 25 The term "arylalkoxy" as used herein, means an aryl group, as defined herein, appended to the parent molecular moiety through an alkoxy group, as defined herein. Representative examples of arylalkoxy include, but are not limited to, 2-phenylethoxy, 3-naphth-2-ylpropoxy, and 5-phenylpentyloxy.

- The term "arylalkoxycarbonyl" as used herein, means an arylalkoxy group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as
30 defined herein. Representative examples of arylalkoxycarbonyl include, but are not limited to, benzyloxycarbonyl and naphth-2-ylmethoxycarbonyl.

The term "arylalkyl" as used herein, means an aryl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein.

Representative examples of arylalkyl include, but are not limited to, benzyl, 2-phenylethyl, 3-phenylpropyl, and 2-naphth-2-ylethyl.

The term "arylalkylthio" as used herein, means an arylalkyl group, as defined herein, appended to the parent molecular moiety through a sulfur atom.

- 5 Representative examples of arylalkylthio include, but are not limited to, 2-phenylethylthio, 3-naphth-2-ylpropylthio, and 5-phenylpentylthio.

The term "arylcarbonyl" as used herein, means an aryl group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of arylcarbonyl include, but are not limited to,
10 benzoyl and naphthoyl.

The term "aryloxy" as used herein, means an aryl group, as defined herein, appended to the parent molecular moiety through an oxygen atom. Representative examples of aryloxy include, but are not limited to, phenoxy, naphthyloxy, 3-bromophenoxy, 4-chlorophenoxy, 4-methylphenoxy, and 3,5-dimethoxyphenoxy.

- 15 The term "aryloxyalkyl" as used herein, means an aryloxy group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of aryloxyalkyl include, but are not limited to, 2-phenoxyethyl, 3-naphth-2-yloxypropyl and 3-bromophenoxymethyl.

The term "arylthio" as used herein, means an aryl group, as defined herein, appended to the parent molecular moiety through a sulfur atom. Representative
20 examples of arylthio include, but are not limited to, phenylthio and 2-naphthylthio.

The term "arylthioalkyl" as used herein, means an arylthio group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of arylthioalkyl include, but are not limited to,
25 phenylthiomethyl, 2-naphth-2-ylthioethyl, and 5-phenylthiomethyl.

The term "azido" as used herein, means a -N₃ group.

The term "carbonyl" as used herein, means a -C(O)- group.

The term "carboxy" as used herein, means a -CO₂H group.

The term "carboxyalkyl" as used herein, means a carboxy group, as defined
30 herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of carboxyalkyl include, but are not limited to, carboxymethyl, 2-carboxyethyl, and 3-carboxypropyl.

The term "cyano" as used herein, means a -CN group.

The term "cyanoalkyl" as used herein, means a cyano group, as defined herein,

appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of cyanoalkyl include, but are not limited to, cyanomethyl, 2-cyanoethyl, and 3-cyanopropyl.

The term "cycloalkenyl" as used herein, means a cyclic hydrocarbon containing from 3 to 8 carbons and containing at least one carbon-carbon double bond formed by the removal of two hydrogens. Representative examples of cycloalkenyl include, but are not limited to, 2-cyclohexen-1-yl, 3-cyclohexen-1-yl, 2,4-cyclohexadien-1-yl and 3-cyclopenten-1-yl.

The term "cycloalkyl" as used herein, means a monocyclic, bicyclic, or tricyclic ring system. Monocyclic ring systems are exemplified by a saturated cyclic hydrocarbon group containing from 3 to 8 carbon atoms. Examples of monocyclic ring systems include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl. Bicyclic ring systems are exemplified by a bridged monocyclic ring system in which two adjacent or non-adjacent carbon atoms of the monocyclic ring are linked by an alkylene bridge of between one and three additional carbon atoms. Representative examples of bicyclic ring systems include, but are not limited to, bicyclo[3.1.1]heptane, bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane, bicyclo[3.2.2]nonane, bicyclo[3.3.1]nonane, and bicyclo[4.2.1]nonane. Tricyclic ring systems are exemplified by a bicyclic ring system in which two non-adjacent carbon atoms of the bicyclic ring are linked by a bond or an alkylene bridge of between one and three carbon atoms. Representative examples of tricyclic-ring systems include, but are not limited to, tricyclo[3.3.1.0^{3,7}]nonane and tricyclo[3.3.1.1^{3,7}]decane (adamantane).

The cycloalkyl groups of the invention are optionally substituted with 1, 2, 3, 4 or 5 substituents selected from the group consisting of alkenyl, alkoxy, alkoxyalkoxy, alkoxyalkyl, alkoxycarbonyl, alkoxysulfonyl, alkyl, alkylcarbonyl, alkylcarbonyloxy, alkylsulfonyl, alkylthio, alkylthioalkyl, alkynyl, carboxy, cyano, formyl, haloalkoxy, haloalkyl, halogen, hydroxy, hydroxyalkyl, mercapto, oxo, -NZ₁Z₂, and (NZ₃Z₄)carbonyl.

The term "cycloalkylalkyl" as used herein, means a cycloalkyl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of cycloalkylalkyl include, but are not limited to, cyclopropylmethyl, 2-cyclobutylethyl, cyclopentylmethyl, cyclohexylmethyl, and

4-cycloheptylbutyl.

The term "cycloalkylcarbonyl" as used herein, means cycloalkyl group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of cycloalkylcarbonyl include, but are not limited to, cyclopropylcarbonyl, 2-cyclobutylcarbonyl, and cyclohexylcarbonyl.

The term "cycloalkyloxy" as used herein, means cycloalkyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom, as defined herein. Representative examples of cycloalkyloxy include, but are not limited to, cyclopropyloxy, cyclobutyloxy, cyclopentyloxy, cyclohexyloxy, cycloheptyloxy, and cyclooctyloxy.

The term "cycloalkylthio" as used herein, means cycloalkyl group, as defined herein, appended to the parent molecular moiety through a sulfur atom, as defined herein. Representative examples of cycloalkylthio include, but are not limited to, cyclopropylthio, cyclobutylthio, cyclopentylthio, cyclohexylthio, cycloheptylthio, and cyclooctylthio.

The term "ethylenedioxy" as used herein, means a $-O(CH_2)_2O-$ group wherein the oxygen atoms of the ethylenedioxy group are attached to the parent molecular moiety through one carbon atom forming a 5 membered ring or the oxygen atoms of the ethylenedioxy group are attached to the parent molecular moiety through two adjacent carbon atoms forming a six membered ring.

The term "formyl" as used herein, means a $-C(O)H$ group.

The term "formylalkyl" as used herein, means a formyl group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of formylalkyl include, but are not limited to, formylmethyl and 2-formylethyl.

The term "halo" or "halogen" as used herein, means $-Cl$, $-Br$, $-I$ or $-F$.

The term "haloalkoxy" as used herein, means at least one halogen, as defined herein, appended to the parent molecular moiety through an alkoxy group, as defined herein. Representative examples of haloalkoxy include, but are not limited to, chloromethoxy, 2-fluoroethoxy, trifluoromethoxy, and pentafluoroethoxy.

The term "haloalkyl" as used herein, means at least one halogen, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of haloalkyl include, but are not limited to, chloromethyl, 2-fluoroethyl, trifluoromethyl, pentafluoroethyl, and 2-chloro-3-

fluoropentyl.

The term "heteroaryl," as used herein, means a monocyclic heteroaryl or a bicyclic heteroaryl. The monocyclic heteroaryl is a 5 or 6 membered ring that contains at least one heteroatom selected from the group consisting of nitrogen, oxygen and sulfur. The 5 membered ring contains two double bonds and the 6 membered ring contains three double bonds. The 5 or 6 membered heteroaryl is connected to the parent molecular moiety through any carbon atom or any substitutable nitrogen atom contained within the heteroaryl, provided that proper valance is maintained. Representative examples of monocyclic heteroaryl include, but are not limited to, furyl, imidazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, oxazolyl, pyridinyl, pyridazinyl, pyrimidinyl, pyrazinyl, pyrazolyl, pyrrolyl, tetrazolyl, thiadiazolyl, thiazolyl, thienyl, triazolyl, and triazinyl. The bicyclic heteroaryl consists of a monocyclic heteroaryl fused to a phenyl, or a monocyclic heteroaryl fused to a cycloalkyl, or a monocyclic heteroaryl fused to a cycloalkenyl, or a monocyclic heteroaryl fused to a monocyclic heteroaryl. The bicyclic heteroaryl is connected to the parent molecular moiety through any carbon atom or any substitutable nitrogen atom contained within the bicyclic heteroaryl, provided that proper valance is maintained. Representative examples of bicyclic heteroaryl include, but are not limited to, azaindolyl, benzimidazolyl, benzofuranyl, benzoxadiazolyl, benzoisoxazole, benzoisothiazole, benzooxazole, 1,3-benzothiazolyl, benzothienyl(or benzothiophenyl), cinnolinyl, furopyridine, indolyl, indazolyl, indolinonyl, isobenzofuran, isoindolyl, isoquinolinyl, naphthyridinyl, oxadiazolyl, oxazolopyridine, quinolinyl, quinoxalyl, thiadiazolyl and thienopyridinyl.

The heteroaryl groups of the invention are optionally substituted with 1, 2, 3 or 4 substituents independently selected from the group consisting of alkenyl, alkoxy, alkoxyalkoxy, alkoxyalkyl, alkoxycarbonyl, alkoxycarbonylalkyl, alkoxysulfonyl, alkyl, alkylcarbonyl, alkylcarbonylalkyl, alkylcarbonyloxy, alkylthio, alkylthioalkyl, alkynyl, carboxy, carboxyalkyl, cyano, cyanoalkyl, formyl, haloalkoxy, haloalkyl, halogen, hydroxy, hydroxyalkyl, mercapto, nitro, -NZ₁Z₂ and (NZ₃Z₄)carbonyl. Heteroaryl groups of the invention that are substituted with a hydroxy group may be present as tautomers. The heteroaryl groups of the invention encompasses all tautomers including non-aromatic tautomers. In addition, the nitrogen heteroatoms can be optionally quaternized or oxidized to the N-oxide.

The term "heteroarylalkoxy" as used herein, means a heteroaryl group, as

defined herein, appended to the parent molecular moiety through an alkoxy group, as defined herein. Representative examples of heteroarylalkoxy include, but are not limited to, fur-3-ylmethoxy, 1H-imidazol-2-ylmethoxy, 1H-imidazol-4-ylmethoxy, 1-(pyridin-4-yl)ethoxy, pyridin-3-ylmethoxy, 6-chloropyridin-3-ylmethoxy, pyridin-4-ylmethoxy, (6-(trifluoromethyl)pyridin-3-yl)methoxy, (6-(cyano)pyridin-3-yl)methoxy, (2-(cyano)pyridin-4-yl)methoxy, (5-(cyano)pyridin-2-yl)methoxy, (2-(chloro)pyridin-4-yl)methoxy, pyrimidin-5-ylmethoxy, 2-(pyrimidin-2-yl)propoxy, thien-2-ylmethoxy, and thien-3-ylmethoxy.

The term "heteroarylalkyl" as used herein, means a heteroaryl, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heteroarylalkyl include, but are not limited to, fur-3-ylmethyl, 1H-imidazol-2-ylmethyl, 1H-imidazol-4-ylmethyl, 1-(pyridin-4-yl)ethyl, pyridin-3-ylmethyl, 6-chloropyridin-3-ylmethyl, pyridin-4-ylmethyl, (6-(trifluoromethyl)pyridin-3-yl)methyl, (6-(cyano)pyridin-3-yl)methyl, (2-(cyano)pyridin-4-yl)methyl, (5-(cyano)pyridin-2-yl)methyl, (2-(chloro)pyridin-4-yl)methyl, pyrimidin-5-ylmethyl, 2-(pyrimidin-2-yl)propyl, thien-2-ylmethyl, and thien-3-ylmethyl.

The term "heteroarylalkylcarbonyl" as used herein, means a heteroarylalkyl, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein.

The term "heteroarylalkylthio" as used herein, means a heteroarylalkyl group, as defined herein, appended to the parent molecular moiety through a sulfur atom. Representative examples of heteroarylalkylthio include, but are not limited to, fur-3-ylmethylthio, 1H-imidazol-2-ylmethylthio, 1H-imidazol-4-ylmethylthio, pyridin-3-ylmethylthio, 6-chloropyridin-3-ylmethylthio, pyridin-4-ylmethylthio, (6-(trifluoromethyl)pyridin-3-yl)methylthio, (6-(cyano)pyridin-3-yl)methylthio, (2-(cyano)pyridin-4-yl)methylthio, (5-(cyano)pyridin-2-yl)methylthio, (2-(chloro)pyridin-4-yl)methylthio, pyrimidin-5-ylmethylthio, 2-(pyrimidin-2-yl)propylthio, thien-2-ylmethylthio, and thien-3-ylmethylthio.

The term "heteroarylcarbonyl" as used herein, means a heteroaryl group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of heteroarylcarbonyl include, but are not limited to, fur-3-ylcarbonyl, 1H-imidazol-2-ylcarbonyl, 1H-imidazol-4-ylcarbonyl, pyridin-3-ylcarbonyl, 6-chloropyridin-3-ylcarbonyl, pyridin-4-ylcarbonyl,

(6-(trifluoromethyl)pyridin-3-yl)carbonyl, (6-(cyano)pyridin-3-yl)carbonyl, (2-(cyano)pyridin-4-yl)carbonyl, (5-(cyano)pyridin-2-yl)carbonyl, (2-(chloro)pyridin-4-yl)carbonyl, pyrimidin-5-ylcarbonyl, pyrimidin-2-ylcarbonyl, thien-2-ylcarbonyl, and thien-3-ylcarbonyl.

5 The term "heteroaryloxy" as used herein, means a heteroaryl group, as defined herein, appended to the parent molecular moiety through an oxygen atom.

Representative examples of heteroaryloxy include, but are not limited to, fur-3-yloxy, 1H-imidazol-2-yloxy, 1H-imidazol-4-yloxy, pyridin-3-yloxy, 6-chloropyridin-3-yloxy, pyridin-4-yloxy, (6-(trifluoromethyl)pyridin-3-yl)oxy, (6-(cyano)pyridin-3-yl)oxy, (2-(cyano)pyridin-4-yl)oxy, (5-(cyano)pyridin-2-yl)oxy, (2-(chloro)pyridin-4-yl)oxy, pyrimidin-5-yloxy, pyrimidin-2-yloxy, thien-2-yloxy, and thien-3-yloxy.

10

The term "heteroaryloxyalkyl" as used herein, means a heteroaryloxy group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heteroaryloxyalkyl include, but are not limited to, pyridin-3-yloxymethyl and 2-quinolin-3-yloxyethyl.

15

The term "heteroarylthio" as used herein, means a heteroaryl group, as defined herein, appended to the parent molecular moiety through a sulfur atom.

Representative examples of heteroarylthio include, but are not limited to, pyridin-3-ylthio and quinolin-3-ylthio.

20 The term "heteroarylthioalkyl" as used herein, means a heteroarylthio group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heteroarylthioalkyl include, but are not limited to, pyridin-3-ylthiomethyl, and 2-quinolin-3-ylthioethyl.

The term "heterocycle" or "heterocyclic" as used herein, means a monocyclic heterocycle, a bicyclic heterocycle or a tricyclic heterocycle. The monocyclic heterocycle is a 3, 4, 5, 6 or 7 membered ring containing at least one heteroatom independently selected from the group consisting of O, N, and S. The 3 or 4 membered ring contains 1 heteroatom selected from the group consisting of O, N and S. The 5 membered ring contains zero or one double bond and one, two or three heteroatoms selected from the group consisting of O, N and S. The 6 or 7 membered ring contains zero, one or two double bonds and one, two or three heteroatoms selected from the group consisting of O, N and S. The monocyclic heterocycle is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the monocyclic heterocycle. Representative examples of

25

30

monocyclic heterocycle include, but are not limited to, azetidiny, azepanyl, aziridiny, diazepanyl, 1,3-dioxanyl, 1,3-dioxolanyl, 1,3-dithiolanyl, 1,3-dithianyl, imidazoliny, imidazolidiny, isothiazoliny, isothiazolidiny, isoxazoliny, isoxazolidiny, morpholiny, oxadiazoliny, oxadiazolidiny, oxazoliny, oxazolidiny, piperaziny, piperidiny, pyranyl, pyrazoliny, pyrazolidiny, pyrroliny, pyrrolidiny, tetrahydrofuranyl, tetrahydrothienyl, thiadiazoliny, thiadiazolidiny, thiazoliny, thiazolidiny, thiomorpholiny, 1,1-dioxidothiomorpholiny (thiomorpholine sulfone), thiopyranyl, and trithianyl. The bicyclic heterocycle is a 5 or 6 membered monocyclic heterocycle fused to a phenyl group, or a 5 or 6 membered monocyclic heterocycle fused to a cycloalkyl, or a 5 or 6 membered monocyclic heterocycle fused to a cycloalkenyl, or a 5 or 6 membered monocyclic heterocycle fused to a monocyclic heterocycle. The bicyclic heterocycle is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the bicyclic heterocycle. Representative examples of bicyclic heterocycle include, but are not limited to, 1,3-benzodioxolyl, 1,3-benzodithiolyl, 2,3-dihydro-1,4-benzodioxinyl, benzodioxolyl, 2,3-dihydro-1-benzofuranyl, 2,3-dihydro-1-benzothieryl, chromenyl and 1,2,3,4-tetrahydroquinoliny. The tricyclic heterocycle is a bicyclic heterocycle fused to a phenyl, or a bicyclic heterocycle fused to a cycloalkyl, or a bicyclic heterocycle fused to a cycloalkenyl, or a bicyclic heterocycle fused to a monocyclic heterocycle. The tricyclic heterocycle is connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the tricyclic heterocycle. Representative examples of tricyclic heterocycle include, but are not limited to, 2,3,4,4a,9,9a-hexahydro-1H-carbazolyl, 5a,6,7,8,9,9a-hexahydrodibenzo[b,d]furanyl, and 5a,6,7,8,9,9a-hexahydrodibenzo[b,d]thienyl.

The heterocycles of this invention are optionally substituted with 1, 2, 3 or 4 substituents independently selected from the group consisting of alkenyl, alkoxy, alkoxyalkoxy, alkoxyalkyl, alkoxycarbonyl, alkoxycarbonylalkyl, alkoxysulfonyl, alkyl, alkylcarbonyl, alkylcarbonylalkyl, alkylcarbonyloxy, alkylthio, alkylthioalkyl, alkynyl, carboxy, carboxyalkyl, cyano, cyanoalkyl, formyl, haloalkoxy, haloalkyl, halogen, hydroxy, hydroxyalkyl, mercapto, oxo, -NZ₁Z₂ and (NZ₃Z₄)carbonyl.

The term "heterocyclealkoxy" as used herein, means a heterocycle group, as defined herein, appended to the parent molecular moiety through an alkoxy group, as defined herein. Representative examples of heterocyclealkoxy include, but are not limited to, 2-pyridin-3-ylethoxy, 3-quinolin-3-ylpropoxy, and 5-pyridin-4-

ylpentyloxy.

The term "heterocyclealkyl" as used herein, means a heterocycle, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heterocyclealkyl include, but are not limited to, piperidin-4-ylmethyl, piperazin-1-ylmethyl, 3-methyl-1-pyrrolidin-1-ylbutyl, (1R)-3-methyl-1-pyrrolidin-1-ylbutyl, (1S)-3-methyl-1-pyrrolidin-1-ylbutyl.

The term "heterocyclealkylcarbonyl" as used herein, means a heterocyclealkyl, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of heterocyclealkylcarbonyl include, but are not limited to, piperidin-4-ylmethylcarbonyl, piperazin-1-ylmethylcarbonyl, 3-methyl-1-pyrrolidin-1-ylbutylcarbonyl, (1R)-3-methyl-1-pyrrolidin-1-ylbutylcarbonyl, (1S)-3-methyl-1-pyrrolidin-1-ylbutylcarbonyl.

The term "heterocyclealkylthio" as used herein, means a heterocyclealkyl group, as defined herein, appended to the parent molecular moiety through a sulfur atom. Representative examples of heterocyclealkylthio include, but are not limited to, 2-pyridin-3-ylethythio, 3-quinolin-3-ylpropythio, and 5-pyridin-4-ylpentythio.

The term "heterocyclecarbonyl" as used herein, means a heterocycle, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein.

The term "heterocyclecarbonylalkyl" as used herein, means a heterocyclecarbonyl, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein.

The term "heterocycleoxy" as used herein, means a heterocycle group, as defined herein, appended to the parent molecular moiety through an oxygen atom. Representative examples of heterocycleoxy include, but are not limited to, pyridin-3-yloxy and quinolin-3-yloxy.

The term "heterocycleoxyalkyl" as used herein, means a heterocycleoxy group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heterocycleoxyalkyl include, but are not limited to, pyridin-3-yloxymethyl and 2-quinolin-3-yloxyethyl.

The term "heterocyclethio" as used herein, means a heterocycle group, as defined herein, appended to the parent molecular moiety through a sulfur atom. Representative examples of heterocyclethio include, but are not limited to, pyridin-3-ylthio and quinolin-3-ylthio.

The term "heterocyclethioalkyl" as used herein, means a heterocyclethio group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of heterocyclethioalkyl include, but are not limited to, pyridin-3-ylthiomethyl, and 2-quinolin-3-ylthioethyl.

5 The term "hydroxy" as used herein, means an -OH group.

The term "hydroxyalkyl" as used herein, means at least one hydroxy group, as defined herein, is appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of hydroxyalkyl include, but are not limited to, hydroxymethyl, 2-hydroxyethyl, 3-hydroxypropyl, 2,3-dihydroxypentyl, and 2-ethyl-4-hydroxyheptyl.

10

The term "hydroxy-protecting group" or "O-protecting group" means a substituent which protects hydroxy groups against undesirable reactions during synthetic procedures. Examples of hydroxy-protecting groups include, but are not limited to, substituted methyl ethers, for example, methoxymethyl, benzyloxymethyl, 2-methoxyethoxymethyl, 2-(trimethylsilyl)-ethoxymethyl, benzyl, and triphenylmethyl; tetrahydropyranyl ethers; substituted ethyl ethers, for example, 2,2,2-trichloroethyl and t-butyl; silyl ethers, for example, trimethylsilyl, t-butyldimethylsilyl and t-butyldiphenylsilyl; cyclic acetals and ketals, for example, methylene acetal, acetonide and benzylidene acetal; cyclic ortho esters, for example, methoxymethylene; cyclic carbonates; and cyclic boronates. Commonly used hydroxy-protecting groups are disclosed in T.W. Greene and P.G.M. Wuts, Protective Groups in Organic Synthesis, 3rd edition, John Wiley & Sons, New York (1999).

15

20

The term "lower alkenyl" as used herein, is a subset of alkenyl, as defined herein, and means an alkenyl group containing from 2 to 4 carbon atoms. Examples of lower alkenyl are ethenyl, propenyl, and butenyl.

25

The term "lower alkoxy" as used herein, is a subset of alkoxy, as defined herein, and means a lower alkyl group, as defined herein, appended to the parent molecular moiety through an oxygen atom, as defined herein. Representative examples of lower alkoxy include, but are not limited to, methoxy, ethoxy, propoxy, 2-propoxy, butoxy, and tert-butoxy.

30

The term "lower alkyl" as used herein, is a subset of alkyl as defined herein and means a straight or branched chain hydrocarbon group containing from 1 to 4 carbon atoms. Examples of lower alkyl are methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, sec-butyl, and tert-butyl.

The term "lower alkylthio" as used herein, is a subset of alkylthio, means a lower alkyl group, as defined herein, appended to the parent molecular moiety through a sulfur atom. Representative examples of lower alkylthio include, but are not limited to, methylthio, ethylthio, and tert-butylthio.

5 The term "lower alkynyl" as used herein, is a subset of alkynyl, as defined herein, and means an alkynyl group containing from 2 to 4 carbon atoms. Examples of lower alkynyl are ethynyl, propynyl, and butynyl.

10 The term "lower haloalkoxy" as used herein, is a subset of haloalkoxy, as defined herein, and means a straight or branched chain haloalkoxy group containing from 1 to 4 carbon atoms. Representative examples of lower haloalkoxy include, but are not limited to, trifluoromethoxy, trichloromethoxy, dichloromethoxy, fluoromethoxy, and pentafluoroethoxy.

15 The term "lower haloalkyl" as used herein, is a subset of haloalkyl, as defined herein, and means a straight or branched chain haloalkyl group containing from 1 to 4 carbon atoms. Representative examples of lower haloalkyl include, but are not limited to, trifluoromethyl, trichloromethyl, dichloromethyl, fluoromethyl, and pentafluoroethyl.

The term "mercapto" as used herein, means a -SH group.

20 The term "mercaptoalkyl" as used herein, means a mercapto group, as defined herein, appended to the parent molecular moiety through an alkyl group, as defined herein. Representative examples of mercaptoalkyl include, but are not limited to, 2-mercaptoethyl and 3-mercaptopropyl.

25 The term "methylenedioxy" as used herein, means a -OCH₂O- group wherein the oxygen atoms of the methylenedioxy are attached to the parent molecular moiety through two adjacent carbon atoms.

30 The term "nitrogen protecting group" as used herein, means those groups intended to protect an amino group against undesirable reactions during synthetic procedures. Preferred nitrogen protecting groups are acetyl, benzoyl, benzyl, benzyloxycarbonyl (Cbz), formyl, phenylsulfonyl, tert-butoxycarbonyl (Boc), tert-butylacetyl, trifluoroacetyl, and triphenylmethyl (trityl).

The term "nitro" as used herein, means a -NO₂ group.

The term "NZ₁Z₂" as used herein, means two groups, Z₁ and Z₂, which are appended to the parent molecular moiety through a nitrogen atom. Z₁ and Z₂ are each independently selected from the group consisting of hydrogen, alkyl, alkylcarbonyl,

alkoxycarbonyl, aryl, arylalkyl, formyl and (NZ₅Z₆)carbonyl. In certain instances within the invention, Z₁ and Z₂ taken together with the nitrogen atom to which they are attached form a heterocyclic ring. Representative examples of NZ₁Z₂ include, but are not limited to, amino, methylamino, acetylamino, acetilmethylamino,

5 phenylamino, benzylamino, azetidiny, pyrrolidinyl and piperidinyl.

The term "NZ₃Z₄" as used herein, means two groups, Z₃ and Z₄, which are appended to the parent molecular moiety through a nitrogen atom. Z₃ and Z₄ are each independently selected from the group consisting of hydrogen, alkyl, aryl and arylalkyl. Representative examples of NZ₃Z₄ include, but are not limited to, amino, methylamino, phenylamino and benzylamino.

10

The term "NZ₅Z₆" as used herein, means two groups, Z₅ and Z₆, which are appended to the parent molecular moiety through a nitrogen atom. Z₅ and Z₆ are each independently selected from the group consisting of hydrogen, alkyl, aryl and arylalkyl. Representative examples of NZ₅Z₆ include, but are not limited to, amino, methylamino, phenylamino and benzylamino.

15

The term "(NZ₃Z₄)carbonyl" as used herein, means a NZ₃Z₄ group, as defined herein, appended to the parent molecular moiety through a carbonyl group, as defined herein. Representative examples of (NZ₃Z₄)carbonyl include, but are not limited to, aminocarbonyl, (methylamino)carbonyl, (dimethylamino)carbonyl, and

20 (ethylmethylamino)carbonyl.

The term "oxo" as used herein, means a =O moiety.

The term "sulfinyl" as used herein, means a -S(O)- group.

The term "sulfonyl" as used herein, means a -SO₂- group.

The term "tautomer" as used herein means a proton shift from one atom of a compound to another atom of the same compound wherein two or more structurally distinct compounds are in equilibrium with each other.

25

Although typically it may be recognized that an asterisk is used to indicate that the exact subunit composition of a receptor is uncertain, for example $\alpha 3\beta 4^*$ indicates a receptor that contains the $\alpha 3$ and $\beta 4$ proteins in combination with other subunits, the term $\alpha 7$ as used herein is intended to include receptors wherein the exact subunit composition is both certain and uncertain. For example, as used herein $\alpha 7$ includes homomeric ($\alpha 7$)₅ receptors and $\alpha 7^*$ receptors, which denote a nAChR containing at least one $\alpha 7$ subunit.

Compounds of the Invention

Compounds of the invention can have the formula (I) as described in the Summary of the Invention.

- 5 Within the scope of the invention, the compounds of the invention have the formula

wherein L_1 , Ar_1 , Ar_2 , L_2 , L_3 , Ar_3 , Ar_4 and Ar_5 are defined in formula (I).

- 10 In one embodiment, the compounds of the invention can have the formula (II) wherein L_1 and Ar_1 are as previously defined for formula (I). In compounds of formula (II), Ar_1 can more particularly be selected from a group having the structure

- 15 wherein D_1 , E_1 , F_1 , J_1 , K_1 , and X_8 - X_{11} are each independently $-CR_1$ or N; X_{12} - X_{15} , M_1 and M_2 are each independently CR_1 , N, or C; G_1 is $-O-$, NR_{1a} , or $-S-$; Y_1 is $-CR_1$ or N; Y_2 is $-CR_1$ or N; Y_3 is NH, $-O-$, or $-S-$; R_1 is hydrogen, alkyl, alkoxy, alkoxycarbonyl, cyano, halo, nitro, $-NR_bR_c$, haloalkyl, or $-C(O)NR_bR_c$; R_{1a} is hydrogen or alkyl; R_b and R_c are each independently hydrogen, alkyl, alkoxycarbonyl or alkylcarbonyl. In a group represented by Ar_1 , preferably no more than two of D_1 , E_1 , F_1 , J_1 , and K_1 are N. In a group represented by Ar_1 , preferably no more than two in the groups X_{12} - X_{15} or

X₈-X₁₁ are N. In a group represented by Ar₁, one of X₁₂-X₁₅ is C. In a group represented by Ar₁, M₁ or M₂ is C. Preferably, Ar₁ is imidazolyl, isoxazolyl, furyl, oxazolyl, phenyl, pyridinyl, pyrimidinyl, pyridazinyl, pyrazinyl, thiophenyl, 1,3-thiazolyl, 1,3,4-thiadiazolyl, 1,3,4-oxadiazolyl, benzoxazolyl, or 1,3-benzothiazolyl.

- 5 Preferred Ar₁ groups are pyridazinyl, pyridinyl, 1,3-thiazolyl, 1,3,4-thiadiazolyl, 1,3,4-oxadiazolyl, benzoxazol-2-yl or 1,3-benzothiazol-2-yl. In a particular embodiment, L₁ is -O- and Ar₁ is as described herein for formula (I) or any of the particular or preferred embodiments. In another particular embodiment, L₁ is -NR_a- and Ar₁ is as described herein for formula (I) or any of the particular or preferred
10 embodiments.

In another embodiment, compounds of the invention can have the formula (III), wherein L₁, Ar₂, L₂, and Ar₃ are as previously described for compounds of formula (I). In compounds of formula (III), Ar₂ can more particularly be selected from a group having the structure

15

- wherein D₂, E₂, F₂, J₂, and K₂ are each independently -CT₂ or N; G₂ is -O-, -NR_{2a}, or -S-; in each group of (i), (ii), and (iii) above, one substituent represented by T₂, or R_{2a} wherein R_{2a} is T₂, is -L₂-Ar₃ and the other substituents represented by T₂ are
20 hydrogen, alkyl, alkoxy, alkoxycarbonyl, cyano, halo, nitro, or -NR_bR_c; R_{2a} is hydrogen, alkyl, or T₂; and R_b and R_c are each independently hydrogen, alkyl, alkoxycarbonyl, or alkylcarbonyl. Ar₃ can more particularly be selected from a group of the structure

- wherein D₃, E₃, F₃, J₃, K₃, and X₈, X₉, X₁₀, and X₁₁ are each independently -CR₃ or N; X₁₆, X₁₇, X₁₈, X₁₉, M₁, and M₂ are each independently -CR₃, N, or C; G₃ is -O-, -NR_{3a}, or -S-; Y₁ and Y₂ are -CR₃ or N; Y₃ is NH, -O-, or -S-; R₃ is hydrogen, alkyl, alkoxy, alkoxyalkyl, alkoxycarbonyl, alkylcarbonyl, cyano, halo, haloalkoxy, haloalkyl, hydroxy, nitro, R_eR_fN-, or aryl; R_{3a} is hydrogen, alkyl, alkylcarbonyl, trityl, or aryl, wherein aryl is preferably phenyl; R_e and R_f are each independently hydrogen, alkyl, alkoxycarbonyl or alkylcarbonyl, or R_e and R_f are each taken together with the nitrogen atom to which they are attached form a heterocyclic ring. The preferred aryl group for R₃ is phenyl optionally substituted with halo, alkyl or cyano. The preferred heterocyclic ring wherein R_e and R_f are each taken together to form a ring is pyrrolidinyl, piperidinyl or piperazinyl. In a group represented by Ar₃, preferably no more than two of D₃, E₃, F₃, J₃, and K₃ are N. In a group represented by Ar₃, preferably no more than two in the groups X₁₆-X₁₉ or X₈-X₁₁ are N. In a group represented by Ar₃, one of X₁₆, X₁₇, X₁₈, or X₁₉ is C. In a group represented by Ar₃, M₁ or M₂ is C. One particular embodiment relates to compounds of formula (III) wherein L₁ is -O- or -NR_{1a} and L₂ is -O-. Compounds of formula (III) wherein L₁ is -O- or -NR_{1a} and L₂ is a bond also are contemplated. Preferably, L₁ is -O-; and L₂ is a bond in compounds of formula (III) wherein Ar₂ and Ar₃ are as previously described

for compounds of formula (I) or particular or preferred embodiments as previously described. In one particular embodiment, the invention relates to compounds of formula (III) wherein L_1 is $-O-$ or $-NR_a$; Ar_2 is phenyl or a heteroaryl ring; L_2 is a bond, $-O-$, $-NR_a-$, $-CH_2-$, or $-C(O)NR_a-$; and Ar_3 is an aryl or heteroaryl ring,

5 preferentially phenyl, pyrazinyl or pyridyl.

In another embodiment, compounds of the invention can have the formula (IV), wherein L_1 , Ar_4 , L_3 , and Ar_5 are as defined for compounds of formula (I).

Preferably, in compounds of formula (IV), $Ar_4-L_3-Ar_5$ group is a group selected from

- 10 wherein Y_4 is $-NR_{4a}-$, $-O-$ or $-S-$; Y_5 and Y_6 are $-N-$, $-CR_4-$ or C , provided that one of Y_5 or Y_6 is C ; R_4 is hydrogen, alkyl, alkoxy, alkoxylalkyl, alkoxycarbonyl, alkylcarbonyl, cyano, halo, haloalkoxy, haloalkyl, hydroxy, nitro, oxo, or R_eR_fN- ; R_{4a} is hydrogen or alkyl; R_e and R_f are each independently hydrogen, alkyl, alkoxycarbonyl, or alkylcarbonyl, or R_e and R_f are each taken together with the
- 15 nitrogen atom to which they are attached form a heterocyclic ring, wherein the heterocyclic ring is preferably pyrrolidinyl, piperidinyl or piperazinyl; X_4 is $-N-$, $-CR_{X4}-$, or C , X_5 is $-N-$, $-CR_{X5}-$, or C , X_6 is $-N-$, $-CR_{X6}-$, or C , and X_7 is $-N-$, $-CR_{X7}-$, or C , provided that only one of X_4 , X_5 , X_6 or X_7 may be $-N-$, only one is C , and the remaining must be other than $-N-$, and R_{X4} , R_{X5} , R_{X6} and R_{X7} are each
- 20 independently hydrogen or alkyl. Preferably Ar_4 is 1,3-benzothiazol-2-yl.

Suitable and preferred groups for Ar_5 in compounds of formula (IV) are as defined for Ar_1 for compounds of formula (II) or Ar_3 for compounds of formula (III).

In addition, the invention also contemplates compounds of formula (VI) or compounds of formula (VII)

25

or a pharmaceutically acceptable salt or prodrug thereof, wherein L_1 is $-O-$ or $-NR_a-$;

A is -Ar₁, -Ar₂-L₂-Ar₃ or -Ar₄-L₃-Ar₅; Ar₁ is aryl or heteroaryl; Ar₂ is aryl or heteroaryl; Ar₃ is aryl or heteroaryl; Ar₄ is a bicyclic heteroaryl; Ar₅ is aryl or heteroaryl; L₂ is a bond, -O-, -NR_a-, -CH₂-, or -C(O)NR_a-; L₃ is a bond, -O-, -NR_a- or -CH₂-; and R_a is hydrogen or alkyl.

- 5 Furthermore, compound of formula (VI) or of formula (VII), are useful as prodrugs of compounds of formula (I).

Specific embodiments contemplated as part of the invention include, but are not limited to compounds of formula (I), or salts or prodrugs thereof, for example:

- (4*s*)-4-(6-chloropyridazin-3-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane;
 10 (4*r*)-4-(6-chloropyridazin-3-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane;
 (4*s*)-4-(6-phenylpyridazin-3-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane;

15 (4*r*)-4-[5-(1-benzofuran-5-yl)pyridin-3-yloxy]-1-azatricyclo[3.3.1.^{3,7}]decane.

Compounds of the invention may exist as stereoisomers wherein, asymmetric or chiral centers are present. These stereoisomers are "R" or "S" depending on the configuration of substituents around the chiral element. The terms "R" and "S" used herein are configurations as defined in IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem., 1976, 45: 13-30. The invention
 20 contemplates various stereoisomers and mixtures thereof and are specifically included within the scope of this invention. Stereoisomers include enantiomers and diastereomers, and mixtures of enantiomers or diastereomers. Individual stereoisomers of compounds of the invention may be prepared synthetically from
 25 commercially available starting materials which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by resolution well-known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography and
 30 optional liberation of the optically pure product from the auxiliary as described in Furniss, Hannaford, Smith, and Tatchell, "Vogel's Textbook of Practical Organic Chemistry", 5th edition (1989), Longman Scientific & Technical, Essex CM20 2JE, England, or (2) direct separation of the mixture of optical enantiomers on chiral chromatographic columns or (3) fractional recrystallization methods.

More particularly, the compounds of the invention can exist in the forms represented by formula (Ia) and (Ib)

The aza-adamantane portion of isomer (Ia) and isomer (Ib) is not chiral, however the C-4 carbon at which L_1 is attached is considered pseudoasymmetric. Compounds represented by formula (Ia) and (Ib) are diastereomers. The configurational assignment of structures of formula (Ia) are assigned *4r* in accordance with that described in Synthesis, 1992, 1080, Becker, D. P.; Flynn, D.L. and as defined in Stereochemistry of Organic Compounds, E.L. Eliel, S.H. Wilen; John Wiley and Sons, Inc. 1994. In addition the configurational assignment of structures of formula (Ib) are assigned *4s* using the same methods.

The isomers (Ia) and (Ib) may be synthesized separately using the individual stereoisomers according to the Schemes or the Experimentals described herein. Alternatively, isomers (Ia) and (Ib) may be synthesized together after which the individual isomers may be separated by chromatographic methods from the mixture of both isomers when mixtures of stereoisomers are used in the synthesis. The mixtures of isomers may also be separated through fractional crystallization of salts of amines contained in the compounds of formula (I) made with enantiomerically pure carboxylic acids.

It is contemplated that a mixture of both isomers may be used to modulate the effects of nAChRs. Furthermore, it is contemplated that the individual isomers of formula (Ia) and (Ib) may be used alone to modulate the effects of nAChRs. Therefore, it is contemplated that either a mixture of the compounds of formula (Ia) and (Ib) or the individual isomers alone represented by the compounds of formula (Ia) or (Ib) would be effective in modulating the effects of nAChRs, and more particularly $\alpha 7$ nAChRs, $\alpha 4\beta 2$ nAChRs, or a combination of $\alpha 7$ nAChRs and $\alpha 4\beta 2$ nAChRs and is thus within the scope of the invention.

More specifically, preferred compounds contemplated as part of the invention include

wherein L_1 , L_2 , L_3 , Ar_1 , Ar_2 , Ar_3 , Ar_4 , and Ar_5 are defined herein.

In addition the use of compounds of formula (V)

5 which may be used to generate compounds of formula (I) are contemplated to be within the scope of the invention.

Also within the scope of the invention are contemplated compounds of formula (VI) and compounds of formula (VII),

10

or a pharmaceutically acceptable salt or prodrug thereof, wherein L_1 is $-O-$ or $-NR_a-$; A is $-Ar_1$, $-Ar_2-L_2-Ar_3$ or $-Ar_4-L_3-Ar_5$; Ar_1 is aryl or heteroaryl; Ar_2 is aryl or monocyclic heteroaryl; Ar_3 is aryl or heteroaryl; Ar_4 is a bicyclic heteroaryl; Ar_5 is aryl or heteroaryl; L_2 is a bond, $-O-$, $-NR_a-$, $-CH_2-$, or $-C(O)NR_a-$; L_3 is a bond, $-O-$, $-NR_a-$ or $-CH_2-$; and R_a is hydrogen or alkyl.

15

In addition, compounds of formula (VI) are useful as a prodrug of a compound of formula (I). Furthermore, compounds of formula (VII) also are useful as a prodrug

of a compound of formula (I).

Specific embodiments contemplated as part of the invention include, but are not limited to compounds of formula (VI), for example:

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride quarterhydrate (1 salt: 0.25 water) crystalline solid can be identified by characteristic peaks in its powder X-ray diffraction pattern (Figure 7). One with skill in the art of analytical chemistry would be able to readily identify (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride quarterhydrate solid by as few as one characteristic peak in its powder X-ray diffraction pattern. Two-theta angle positions of characteristic peaks in a powder X-ray diffraction pattern of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride quarterhydrate are 5.19±0.20, 12.96±0.20, 13.00±0.20, 14.88±0.20, 14.98±0.20, 15.61±0.20, 17.79±0.20, 18.26±0.20, 18.93±0.20, 20.02±0.20, 20.67±0.20, 20.86±0.20, 21.72±0.20, 22.38±0.20, 22.55±0.20, 24.09±0.20, and 26.10±0.20. Crystallographic unit cell parameters of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride quarterhydrate also were obtained and were determined as: *a* is 19.440(7) Å, *b* is 9.969(4) Å, *c* is 35.322(13) Å, and β is 105.325(17)° to afford a cell volume of 6601.91 Å³, wherein *a*,

b, and c are each a representative length of the crystal lattice and β is a unit cell angle.

The salt crystallizes in the monoclinic P21/c space group.

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride sesquihydrate (1 salt:1.5 water) crystalline solid can be identified by characteristic peaks in its powder X-ray diffraction pattern (Figure 8). One with skill

in the art of analytical chemistry would be able to readily identify (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride sesquihydrate solid by as few as one characteristic peak in its powder X-ray diffraction pattern. pattern of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride sesquihydrate are 4.94 ± 0.20 , 9.93 ± 0.20 , 14.09 ± 0.20 , 14.90 ± 0.20 , 17.85 ± 0.20 , 19.92 ± 0.20 , 21.72 ± 0.20 , 22.43 ± 0.20 , 22.63 ± 0.20 , and 23.95 ± 0.20 . The TGA (Figure 8A) shows the dehydration of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride sesquihydrate.

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate crystalline solid can be identified by characteristic peaks in its powder X-ray diffraction pattern (Figure 9). One with skill in the art of analytical chemistry would be able to readily identify (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate solid by as few as one characteristic peak in its powder X-ray diffraction pattern. Two-theta angle positions of characteristic peaks in a powder X-ray diffraction pattern of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate are 7.98 ± 0.20 , 11.98 ± 0.20 , 12.45 ± 0.20 , 15.76 ± 0.20 , 16.00 ± 0.20 , 17.75 ± 0.20 , 18.79 ± 0.20 , 18.82 ± 0.20 , 20.59 ± 0.20 , 22.25 ± 0.20 , 22.61 ± 0.20 , 24.16 ± 0.20 , 24.79 ± 0.20 , 25.06 ± 0.20 , 26.21 ± 0.20 , and 29.43 ± 0.20 . Crystallographic unit cell parameters of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate also were obtained and were determined as: a is 22.651(8) Å, b is 9.992(3) Å, c is 10.338(4) Å, and β is 101.961(5)° to afford a cell volume of 2288.99 Å³, wherein a, b, and c are each a representative length of the crystal lattice and β is a unit cell

angle. The salt crystallizes in the monoclinic P21/c space group.

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane monohydrogen citrate crystalline solid can be identified by characteristic peaks in its powder X-ray diffraction pattern (Figure 10). One with skill in the art of analytical

chemistry would be able to readily identify (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane monohydrogen citrate solid by as few as one characteristic peak in its powder X-ray diffraction pattern. Two-theta angle positions of characteristic peaks in a powder X-ray diffraction pattern of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane monohydrogen citrate are

9.37±0.20, 9.62±0.20, 10.30±0.20, 11.24±0.20, 12.18±0.20, 13.73±0.20, 15.55±0.20, 16.17±0.20, 16.37±0.20, 16.76±0.20, 18.35±0.20, 18.67±0.20, 18.89±0.20, 19.98±0.20, 20.48±0.20, 20.94±0.20, 21.54±0.20, and 22.02±0.20.

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base can be identified by characteristic peaks in its powder X-ray diffraction pattern (Figure 11). One with skill in the art of analytical chemistry would be able to readily identify (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base by as few as one characteristic peak in its powder X-ray diffraction pattern. Two-theta angle positions of characteristic peaks in a powder X-ray diffraction pattern of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base are 7.18±0.20, 10.19±0.20, 13.90±0.20, 14.37±0.20, 14.40±0.20, 14.66±0.20, 15.09±0.20, 15.21±0.20, 18.13±0.20, 18.43±0.20, 19.41±0.20, 19.88±0.20 (two peaks), 20.09±0.20, 20.46±0.20, 21.66±0.20, 23.08±0.20, 26.84±0.20, 28.71±0.20, and 30.90±0.20. Crystallographic unit cell parameters of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base also were obtained and were determined as: *a* is 6.4427(17) Å, *b* is 9.895(3) Å, *c* is 13.102(4) Å, and α is 70.145(4)°, β is 81.691(4)°, and γ is 73.391(4)° to afford a cell volume of 751.787 Å³, wherein *a*, *b*, and *c* are each a representative length of the crystal lattice and α , β , and γ are each a unit cell angle. The salt crystallizes in the triclinic P-1 space group.

As used herein the term “substantially pure”, when used in reference to a salt of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane, refers to a salt that is greater than about 90% pure. The crystalline form of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane does not contain more than about 10% of any other compound and, in particular, does not contain more than about 10% of any other form of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane, such as amorphous, solvated forms, non-solvated forms, desolvated forms, and the enantiomer.

More preferably, a “substantially pure” salt refers to a salt that is greater than about 95% pure, wherein the crystalline form of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane does not contain more than about 5% of any other compound and, in particular, does not contain more than about 5% of any other form of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane, such as amorphous, solvated forms, non-solvated forms, desolvated forms, and the enantiomer.

Even more preferably, a “substantially pure” salt refers to a salt that is greater than about 97% pure, wherein the crystalline form of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane does not contain more than about 3% of any other compound and, in particular, does not contain more than about 3% of any other form of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane, such as amorphous, solvated forms, non-solvated forms, desolvated forms, and the enantiomer.

Compositions comprising (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane salts also are contemplated. A suitable pharmaceutical composition comprises a substantially pure (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane salt formulated together with one or more non-toxic pharmaceutically acceptable carriers as previously described for the compositions. Such compositions comprising (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane salts are administered and can be used in the methods of the invention as previously described for the compounds of the invention, except substituting a desired salt in place of a compound, which would readily be understood by one with skill in the art.

Powder X-ray diffraction (PXRD) analysis of samples was conducted in the following manner. Samples for X-ray diffraction analysis were prepared by spreading the sample in a thin layer on the sample holder and gently flattening the sample with a microscope slide. For example, the sample may have been ground to a fine powder with mortar and pestle, or with glass microscope slides for limited quantity samples. Samples were run in one of three configurations: circular bulk holder, a quartz zero background plate, or hot stage mount (similar mounting to a zero background plate).

Diffraction patterns were collected using an Inel G3000 diffractometer equipped with an incident beam germanium monochromator to provide Cu-K_{α1}

radiation. The X-ray generator was operated at a voltage of 40 kV and a current of 30 mA. The Inel G3000 is equipped with a position sensitive detector that monitors all diffraction data simultaneously. The detector was calibrated by collecting the attenuated direct beam for seven seconds in 1 degree intervals across a 90 degree two
5 theta range. The calibration was checked against a silicon line position reference standard (NIST 640c). Samples were placed on an aluminum sample holder and leveled with a glass slide.

Alternatively, X-ray powder diffraction can be performed using a Rigaku Miniflex diffractometer (30 kV and 15 mA; X-ray source: Cu; Range: 2.00-40.00°
10 Two Theta; Scan rate: 1-5 degree/minute) or a Scintag X1 or X2 diffractometer (2 kW normal focus X-ray tube with either a liquid nitrogen or Peltier cooled germanium solid state detector; 45 kV and 40 mA; X-ray source: Cu; Range: 2.00-40.00° Two Theta; Scan Rate: 1-5 degree/minute).

Characteristic powder X-ray diffraction pattern peak positions are reported in
15 terms of angular positions (two theta) with an allowable variability of $\pm 0.20^\circ$. The variability of $\pm 0.10^\circ$ is intended to be used when comparing two powder X-ray diffraction patterns. In practice, if a diffraction pattern peak from one pattern is assigned a range of angular positions (two theta) which is the measured peak position $\pm 0.20^\circ$ and a diffraction pattern peak from another pattern is assigned a range of
20 angular positions (two theta) which is measured peak position $\pm 0.20^\circ$ and if those ranges of peak position overlap, then the two peaks are considered to have the same angular position (two theta). For example, if a diffraction pattern peak from one pattern is determined to have a peak position of 5.20° for comparison purposes the allowable variability allows the peak to be assigned a position in the range of 5.00° -
25 5.40° . If a comparison peak from the other diffraction pattern is determined to have a peak position of 5.35° and the allowable variability allows the peak to be assigned a position in the range of 5.15° - 5.55° , then the two peaks being compared are considered to have the same angular position (two theta) because there is overlap between the two ranges of peak positions.

30 Single crystal X-ray diffraction analysis of samples was conducted in the following manner. Samples for X-ray diffraction analysis were prepared by affixing selected single crystals to glass pins with epoxy adhesive. X-ray diffraction data was collected using a Bruker SMART system with an APEX area detector (50 kv and 40 mA; X-ray source: Mo). Data were collected at -100°C .

Thermal gravimetric analysis of samples was conducted in the following manner. A Mettler Toledo Model TGA/SDTA 851e thermal gravimetric analysis instrument was used to determine the weight change against sample temperature. Experiments and analysis conducted with Mettler STARe software. The experimental parameters were: sample weight 2-20 mg, placed in an open aluminum pan; heating rate 10 °C per minute, N₂ purge flow rate 50 mL per minute. Samples were heated from 25 °C to 200 °C at a rate of 10 °C per minute.

Methods of the Invention

Compounds and compositions of the invention are useful for modulating the effects of nAChRs, and more particularly $\alpha 7$ nAChRs. In particular, the compounds and compositions of the invention can be used for treating or preventing disorders modulated by $\alpha 7$ nAChRs. Typically, such disorders can be ameliorated by selectively modulating the $\alpha 7$ nAChRs in a mammal, preferably by administering a compound or composition of the invention, either alone or in combination with another active agent, for example, as part of a therapeutic regimen.

In addition, the invention relates to a method for treating or preventing conditions, disorders or deficits modulated by an $\alpha 7$ nicotinic acetylcholine receptor, an $\alpha 4\beta 2$ nicotinic acetylcholine receptor or both $\alpha 7$ and $\alpha 4\beta 2$ nicotinic acetylcholine receptor wherein the condition, disorder, or deficit is selected from the group consisting of a memory disorder, cognitive disorder, neurodegeneration, or neurodevelopmental disorder, or a combination thereof comprising administration of a therapeutically suitable amount of a compound of formula (I),

(I);

or a pharmaceutically acceptable salt or prodrug thereof, wherein L₁ is -O- or -NR_a-; A is -Ar₁, -Ar₂-L₂-Ar₃ or -Ar₄-L₃-Ar₅; Ar₁ is aryl or heteroaryl; Ar₂ is aryl or monocyclic heteroaryl; Ar₃ is aryl or heteroaryl; Ar₄ is a bicyclic heteroaryl; Ar₅ is aryl or heteroaryl; L₂ is a bond, -O-, -NR_a-, -CH₂-, -C(O)NR_a-; L₃ is a bond, -O-, -NR_a- or -CH₂-; and R_a is hydrogen or alkyl.

The invention also contemplates the method for treating or preventing a condition or disorder modulated by an $\alpha 7$ nicotinic acetylcholine receptor comprising the step of administering a compound of the formula (I), wherein the condition or disorder is selected from a memory disorder, cognitive disorder, neurodegeneration, and neurodevelopmental disorder.

The invention also contemplates a method for treating or preventing a condition or disorder modulated by an $\alpha 7$ nicotinic acetylcholine receptor comprising the step of administering a compound of the formula (I), wherein the condition or disorder is selected from attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), mild cognitive impairment, schizophrenia, senile dementia, AIDS dementia, Pick's disease, dementia associated with Lewy bodies, dementia associated with Down's syndrome, amyotrophic lateral sclerosis, Huntington's disease, diminished CNS function associated with traumatic brain injury, acute pain, post-surgical pain, chronic pain and inflammatory pain.

The invention also contemplates a method for treating or preventing a condition or disorder modulated by an $\alpha 7$ nicotinic acetylcholine receptor comprising the step of administering a compound of the formula (I), wherein the condition or disorder is schizophrenia.

The invention also contemplates a method for treating or preventing a condition or disorder modulated by an $\alpha 7$ nicotinic acetylcholine receptor comprising the step of administering a compound of the formula (I) in combination with an atypical antipsychotic.

The invention also contemplates a method for treating or preventing a condition or disorder modulated by an $\alpha 7$ nicotinic acetylcholine receptor comprising the step of administering a compound of the formula (I), wherein the condition or disorder is infertility, lack of circulation, need for new blood vessel growth associated with wound healing, more particularly circulation around a vascular occlusion, need for new blood vessel growth associated with vascularization of skin grafts, ischemia, inflammation, particularly those associated with rheumatoid arthritis, wound healing, and other complications associated with diabetes.

The invention also contemplates a method for treating or preventing a condition or disorder modulated both by $\alpha 7$ and $\alpha 4\beta 2$ nicotinic acetylcholine receptors comprising the step of administering a compound of the formula (I),

wherein the condition or disorder is selected from a group of disorders where both $\alpha 7$ and $\alpha 4\beta 2$ nicotinic receptors are implicated. These include attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), mild cognitive impairment, schizophrenia, senile dementia, AIDS dementia, Pick's disease, dementia associated with Lewy bodies, dementia associated with Down's syndrome, amyotrophic lateral sclerosis, Huntington's disease, inflammation, arthritis of various types, smoking cessation, nicotinic withdrawal syndrome, traumatic brain injury, acute pain, post-surgical pain, osteoarthritic pain, neuropathic and inflammatory chronic pain states.

Compounds for the method of the invention, including but not limited to those specified in the examples or otherwise specifically named, can modulate, and often possess an affinity for, nAChRs, and more particularly $\alpha 7$ nAChRs. As $\alpha 7$ nAChRs ligands, the compounds of the invention can be useful for the treatment or prevention of a number of $\alpha 7$ nAChR-mediated diseases or conditions. Certain compounds of the invention includes, in addition to affinity for $\alpha 7$ nAChRs, affinity for $\alpha 4\beta 2$ nAChRs.

For example, $\alpha 7$ nAChRs have been shown to play a significant role in enhancing cognitive function, including aspects of learning, memory and attention (Levin, E.D., J. Neurobiol. 53: 633-640, 2002). As such, $\alpha 7$ ligands are suitable for the treatment of conditions and disorders related to memory and/or cognition including, for example, attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), mild cognitive impairment, senile dementia, AIDS dementia, Pick's disease, dementia associated with Lewy bodies, and dementia associated with Down's syndrome, as well as cognitive deficits associated with schizophrenia.

In addition, $\alpha 7$ -containing nAChRs have been shown to be involved in the cytoprotective effects of nicotine both in vitro (Jonnala, R. B. and Buccafusco, J. J., J. Neurosci. Res. 66: 565-572, 2001) and in vivo (Shimohama, S. et al., Brain Res. 779: 359-363, 1998). More particularly, neurodegeneration underlies several progressive CNS disorders, including, but not limited to, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, dementia with Lewy bodies, as well as diminished CNS function resulting from traumatic brain injury. For example, the impaired function of $\alpha 7$ nAChRs by β -amyloid peptides linked to

Alzheimer's disease has been implicated as a key factor in development of the cognitive deficits associated with the disease (Liu, Q.-S., Kawai, H., Berg, D. K., PNAS 98: 4734-4739, 2001). $\alpha 7$ selective ligands can influence neuroprotective pathways leading to decreased phosphorylation of the tau protein, whose hyperphosphorylation is required for neurofibrillary tangle formation in various tau related pathologies such as Alzheimer's disease and various other dementias (Bitner et al., Soc. Neuroscience, 2006 abst 325.6). The activation of $\alpha 7$ nAChRs has been shown to block this neurotoxicity (Kihara, T. et al., J. Biol. Chem. 276: 13541-13546, 2001). As such, selective ligands that enhance $\alpha 7$ activity can counter the deficits of Alzheimer's and other neurodegenerative diseases.

Alpha-7 nAChRs also have been implicated in aspects of neurodevelopment, for example neurogenesis of the brain. (Falk, L. et al., Developmental Brain Research 142:151-160, 2003; Tsuneki, H., et al., J. Physiol. (London) 547:169-179, 2003; Adams, C.E., et al., Developmental Brain Research 139:175-187, 2002). As such, $\alpha 7$ nAChRs can be useful in preventing or treating conditions or disorders associated with impaired neurodevelopment, for example schizophrenia. (Sawa A., Mol. Med. 9:3-9, 2003).

Several compounds with high affinity for $\alpha 4\beta 2$ neuronal nicotinic receptors (NNRs) have been shown to improve attentive and cognitive performance in preclinical models that are relevant to attention-deficit/hyperactivity disorder (ADHD), a disease characterized by core symptoms of hyperactivity, inattentiveness, and impulsivity. For example, ABT-418, a full agonist at $\alpha 4\beta 2$ NNRs is efficacious in a variety of preclinical cognition models. ABT-418 administered transdermally, was shown in a controlled clinical trial in 32 adults to be effective in treating ADHD in general, and attentional/cognitive deficits in particular (Wilens, T.E.; Biederman, J.; Spencer, T.J.; Bostic, J.; Prince, J.; Monuteaux, M.C.; Soriano, J.; Fince, C.; Abrams, A.; Rater, M.; Polisner, D. The American Journal of Psychiatry (1999) 156(12), 1931-1937.). Likewise, ABT-418 showed a signal of efficacy in a pilot Alzheimer's disease trial. ABT-089, a $\alpha 4\beta 2$ selective partial agonist, has been shown in rodent and primate animal models to improve attention, learning, and memory deficits. ABT-089 and another $\alpha 4\beta 2$ agonist, ispronicline has shown efficacy in a pilot clinical trials. In addition to cognition, compounds that interact with $\alpha 4\beta 2$ nAChRs such as ABT-594 and others are also efficacious in preclinical and clinical

models of pain. As such, ligands that modulate both $\alpha 7$ and $\alpha 4\beta 2$ activity can have broader spectrum of therapeutic efficacy in disease states such as those involving cognitive and attentive deficits, pain, neurodegenerative diseases and others.

Schizophrenia is a complex disease that is characterized by abnormalities in perception, cognition, and emotions. Significant evidence implicates the involvement of $\alpha 7$ nAChRs in this disease, including a measured deficit of these receptors in post-mortem patients (Sawa A., *Mol. Med.* 9:3-9, 2003; Leonard, S. *Eur. J. Pharmacol.* 393: 237-242, 2000). Deficits in sensory processing (gating) are one of the hallmarks of schizophrenia. These deficits can be normalized by nicotinic ligands that operate at the $\alpha 7$ nAChR (Adler L. E. et al., *Schizophrenia Bull.* 24: 189-202, 1998; Stevens, K. E. et al., *Psychopharmacology* 136: 320-327, 1998). More recent studies have shown that $\alpha 4\beta 2$ nicotinic receptor stimulation also contributes to the effects of nicotine in the DBA/2 mouse model of sensory gating (Radek et al., *Psychopharmacology (Berl)*. 2006 187:47-55. Thus, $\alpha 7$ and $\alpha 7/\alpha 4\beta 2$ ligands demonstrate potential in the treatment of schizophrenia.

Angiogenesis, a process involved in the growth of new blood vessels, is important in beneficial systemic functions, such as wound healing, vascularization of skin grafts, and enhancement of circulation, for example, increased circulation around a vascular occlusion. Non-selective nAChR agonists like nicotine have been shown to stimulate angiogenesis (Heeschen, C. et al., *Nature Medicine* 7: 833-839, 2001). Improved angiogenesis has been shown to involve activation of the $\alpha 7$ nAChR (Heeschen, C. et al., *J. Clin. Invest.* 110: 527-536, 2002). For example, improved conditions related to inflammation, ischemia, cardiac ischemia, and wound healing, for example in diabetic persons, have been associated with $\alpha 7$ nAChR activity (Jacobi, J., et al., *Am. J. Pathol.* 161:97-104, 2002). Therefore, nAChR ligands that are selective for the $\alpha 7$ subtype offer improved potential for stimulating angiogenesis with an improved side effect profile.

A population of $\alpha 7$ or $\alpha 4\beta 2$ nAChRs in the spinal cord modulate neurotransmission that have been associated with the pain-relieving effects of nicotinic compounds (Cordero-Erausquin, M. and Changeux, J.-P. *PNAS* 98:2803-2807, 2001). The $\alpha 7$ nAChR or and $\alpha 7/\alpha 4\beta 2$ ligands demonstrate therapeutic potential for the treatment of pain states, including acute pain, post-surgical pain, as well as chronic pain states including inflammatory pain and

neuropathic pain. Moreover, $\alpha 7$ nAChRs are expressed on the surface of primary macrophages that are involved in the inflammation response, and that activation of the $\alpha 7$ receptor inhibits release of TNF and other cytokines that trigger the inflammation response (Wang, H. et al Nature 421: 384-388, 2003). Therefore, selective $\alpha 7$ ligands demonstrate potential for treating conditions involving inflammation including those associated with various forms of arthritis.

The mammalian sperm acrosome reaction is an exocytosis process important in fertilization of the ovum by sperm. Activation of an $\alpha 7$ nAChR on the sperm cell has been shown to be essential for the acrosome reaction (Son, J.H. and Meizel, S. Biol. Reproduct. 68: 1348-1353 2003). Consequently, selective $\alpha 7$ agents demonstrate utility for treating fertility disorders.

Compounds of the invention are particularly useful for treating and preventing a condition or disorder affecting memory, cognition, neurodegeneration, neurodevelopment, and schizophrenia.

Cognitive impairment associated with schizophrenia often limits the ability of patients to function normally, a symptom not adequately treated by commonly available treatments, for example, treatment with an atypical antipsychotic. (Rowley, M. et al., J. Med. Chem. 44: 477-501, 2001). Such cognitive deficit has been linked to dysfunction of the nicotinic cholinergic system, in particular with decreased activity at $\alpha 7$ receptors. (Friedman, J. I. et al., Biol Psychiatry, 51: 349-357, 2002). Thus, activators of $\alpha 7$ receptors can provide useful treatment for enhancing cognitive function in schizophrenic patients who are being treated with atypical antipsychotics. Accordingly, the combination of an $\alpha 7$ nAChR ligand and an atypical antipsychotic would offer improved therapeutic utility. Specific examples of suitable atypical antipsychotics include, but are not limited to, clozapine, risperidone, olanzapine, quetiapine, ziprasidone, zotepine, iloperidone, and the like.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention can be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the

compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

When used in the above or other treatments, a therapeutically effective amount of one of the compounds of the invention can be employed in pure form or, where
5 such forms exist, in pharmaceutically acceptable salt, ester, amide, or prodrug form. Alternatively, the compound can be administered as a pharmaceutical composition containing the compound of interest in combination with one or more pharmaceutically acceptable carriers. The phrase "therapeutically effective amount" of the compound of the invention means a sufficient amount of the compound to treat
10 disorders, at a reasonable benefit/risk ratio applicable to any medical treatment. It will be understood, however, that the total daily usage of the compounds and compositions of the invention will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder
15 being treated and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like
20 factors well-known in the medical arts. For example, it is well within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The total daily dose of the compounds of this invention administered to a
25 human or lower animal range from about 0.10 $\mu\text{g/kg}$ body weight to about 10 mg/kg body weight. More preferable doses can be in the range of from about 0.10 $\mu\text{g/kg}$ body weight to about 1 mg/kg body weight. If desired, the effective daily dose can be divided into multiple doses for purposes of administration. Consequently, single dose compositions may contain such amounts or submultiples thereof to make up the daily
30 dose.

Methods for Preparing Compounds of the Invention

As used in the descriptions of the schemes and the examples, certain

abbreviations are intended to have the following meanings: Bu for butyl; DMAP for 4-dimethylaminopyridine; DMF for dimethyl formamide; DME for 1,2-dimethoxyethane; EDAC for *N*-(3-dimethylaminopropyl)-*N'*-ethylcarbodiimide hydrochloride, Et for ethyl; EtOAc for ethyl acetate; eq. for equivalents; HOBt for hydroxybenzotriazole; HPLC for high pressure liquid chromatography; mCPBA for *m*-chloroperbenzoic acid; Me for methyl; MeOH for methanol; OAc for acetoxy; OTf for trifluoromethanesulfonate; Pd/C for palladium on carbon; Ph for phenyl; THF for tetrahydrofuran; and TLC for thin layer chromatography.

The reactions exemplified in the schemes are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformations being effected. The described transformations may require modifying the order of the synthetic steps or selecting one particular process scheme over another in order to obtain a desired compound of the invention, depending on the functionality present on the molecule.

Nitrogen protecting groups can be used for protecting amine groups present in the described compounds. Such methods, and some suitable nitrogen protecting groups, are described in Greene and Wuts (Protective Groups In Organic Synthesis, Wiley and Sons, 1999). For example, suitable nitrogen protecting groups include, but are not limited to, tert-butoxycarbonyl (Boc), benzyloxycarbonyl (Cbz), benzyl (Bn), acetyl, and trifluoroacetyl. More particularly, the Boc protecting group may be removed by treatment with an acid such as trifluoroacetic acid or hydrochloric acid. The Cbz and Bn protecting groups may be removed by catalytic hydrogenation. The acetyl and trifluoroacetyl protecting groups may be removed by a hydroxide ion.

Scheme 1

As outlined in Scheme 1, compound of formula 1 (commercially available from Aldrich Chemical Co., [4746-97-8]) when treated with tosylmethyl isocyanide

(TOSMIC, commercially available from Aldrich Chemical Co., [36635-61-7]) in the presence of a base such as potassium tert-butoxide in a solvent such as ethylene glycol dimethyl ether will provide the compound of formula 2. Compound of formula 2 when treated with lithium aluminum hydride in THF will provide the compound of formula 3. Compound of formula 3 when treated with paraformaldehyde along with sulfuric acid in ethanol will provide the compound of formula 4 (1-azaadamantan-4-one). A further description of the synthesis may be found in Synthesis, 1992, 1080, Becker, D. P ; Flynn, D.L.

10

As outlined in Scheme 2, compounds of formula 4 (1-azaadamantan-4-one) when treated with borane-THF complex in THF will provide the borane complexed amine, which when further treated with a reducing agent such as sodium borohydride in methanol will provide compounds of formula 5 which consists of a mixture of (*r*) and (*s*) isomers. The compound of formula 5 may be further treated according to the methods outlined in the Schemes 3-11 to obtain an (*rs*) mixture of the compound of formula (I), or the mixture may be separated into the individual (*r*) or (*s*) isomers and then treated according to the methods outlined in the Schemes 3-11 to generate a single (*r*) or (*s*) isomer of the compounds of formula (I). To effect the separation of the (*r*) isomer from the (*s*) isomer, the treatment of the compound of formula 5 with reagents such as a substituted benzoic acid (for example para-chlorobenzoic acid) and

N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride (EDAC) in the presence of 4-dimethyl aminopyridine in a solvent, such as dichloromethane, will provide compounds of formula 6 and 7. The mixture of compounds of formula 6 and 7 may be separated through the use of chromatographic procedures known to one skilled in the art. The individual isomers, the compound of formula 6 or the compound of formula 7, when further treated with sodium hydroxide in a mixture of THF and water will provide the compound of formula 8 or the compound of formula 9, respectively.

Scheme 3

wherein X-A is defined as

and X is halo

As outlined in Scheme 3, compounds of formula 10, which may be either the mixture of compounds of formula 8 and 9 or the individual isomers represented by the compound of formula 8 or the compound of formula 9, or the corresponding free amine lacking the borane group, when treated with sodium hydride in DMF, potassium tert butoxide, or potassium bis(trimethylsilylamide), in THF or DMSO followed by treatment with compounds of formula 11, wherein X is chloro, bromo, fluoro or iodo and A is as defined for compounds of formula (I), and more particularly for Ar₁ of compounds of formula (II) or similarly Ar₂ of compounds of formula (III), will provide compounds of formula 12. Compounds of formula 12 when treated with either aqueous hydrochloric acid in acetone or with palladium on carbon in methanol will provide compounds of formula 13 which are representative of compounds of the invention.

As shown in Scheme 4, compounds of formula 15 and 16 each represent compounds of formula A-X, wherein A is Ar_1 and is defined in formula (I) and X is chloro or bromo. Compounds of formula 15 and of formula 16 may be obtained from compounds of formula $\text{H}_2\text{N}-\text{Ar}_1$ as outlined. Compounds of formula $\text{H}_2\text{N}-\text{Ar}_1$ (formula 14) wherein D_1 , E_1 , F_1 , J_1 , and K_1 are each independently $-\text{CR}_{1a}$ or N, G is $-\text{O}-$, $-\text{NR}_{1a}$, or $-\text{S}-$, R_1 is hydrogen, alkyl, alkoxy, alkoxy carbonyl, cyano, halo, nitro or $-\text{NR}_b\text{R}_c$, R_{1a} is hydrogen or alkyl, R_b and R_c are each independently hydrogen, alkyl, alkoxy carbonyl or alkyl carbonyl, and n is 0, 1, 2 or 3 for groups shown in Scheme 4, when treated with cuprous bromide and tert butyl nitrite in acetonitrile will provide compounds of formula 15. Alternatively, compounds of formula 14, wherein Ar_1 is as defined above in Scheme 4 when treated with copper powder, aqueous hydrochloric acid, sodium nitrite in a solution of aqueous acetic acid will provide compounds of formula 16. Furthermore, when either compounds of formula 15 or compounds of formula 16 are subjected to the conditions outlined in Scheme 3 compounds of formula 17 which are representative of compounds of the invention which contain an A group that is defined as Ar_1 or Ar_2 in formula (I), will be provided.

Scheme 5

- As outlined in Scheme 5, compounds of formula 18, wherein G is -O-, NR_{1a}, or -S-, and R_{1a} is hydrogen or alkyl, when treated with compounds of formula 19, wherein Ar₃ as defined for compounds of formula (I), in the presence of cesium carbonate and a solvent such as but not limited to THF will provide compounds of formula 20, which are representative of compounds of formula A-X, (compounds of formula 11), described in Scheme 3, wherein A is -Ar₂-L₂-Ar₃ as defined in formula (I). When compounds of formula 20 and compounds of formula 10 are treated according to the conditions outlined in Scheme 3, compounds of formula 21 are obtained. When compounds of formula 21 are treated with aqueous hydrochloric acid in acetone or with palladium on carbon in methanol, compounds of formula 22 are obtained which are representative of compounds of the invention which contain an A group that is defined as -Ar₂-L₂-Ar₃ in formula (I).

Scheme 6

As outlined in Scheme 6, compounds of formula 23, wherein D, E, J, K, and M are each independently $-\text{CR}_{2a}-$, $-\text{CX}^2-$, or $-\text{N}-$, X^2 is halo, haloalkyl, cyano, or nitro, when treated with either tert-butyl nitrite and tetrafluoroboric acid, or sodium nitrite and tetrafluoroboric acid, will provide compounds of formula 24. Compounds of formula 24 when treated with compounds of formula 10 in the presence of a base such as but not limited to, either sodium hydride in DMF, potassium tert butoxide in THF or potassium bis(hexamethyldi-silylamine) in THF will provide compounds of formula 25. Compounds of formula 25 when treated with either aqueous hydrochloric acid in acetone or with palladium on carbon in methanol will provide compounds of formula 26, which are representative of compounds of the invention.

Scheme 7

As outlined in Scheme 7, compounds of formula 27, wherein Ar_2 is defined in formula (I) and X^3 is halo or $-\text{O}-\text{trifluoromethanesulfonyl}$, which can be obtained according to the methods outlined in Schemes 3, 4, or 6, when heated in the presence of $\text{Ar}_3\text{-B(OH)}_2$, a palladium catalyst, as known to one skilled in the art, and potassium carbonate in a solvent such as, but not limited to, a mixture of dioxane and water or an alcoholic solvent such as ethanol under heated conditions, will provide compounds of formula 28 which is representative of compounds of the invention, wherein A is $-\text{Ar}_2\text{-L}_2\text{-Ar}_3$, and L_2 is a bond. Alternatively, compounds of formula 30, which contain a boronic acid or a boronic acid ester, wherein R_x is hydrogen or alkyl, which may be obtained according to the methods described herein, when treated with $\text{Ar}_3\text{-X}$, wherein Ar_3 is defined in formula (I) and X is chloro, bromo or $-\text{O}-\text{trifluoromethanesulfonyl}$ in the presence of a palladium catalyst as known to one skilled in the art and potassium carbonate in a mixture of solvents such as, but not limited to, a mixture of dioxane and an alcoholic solvent, for example ethanol, under heated conditions will also provide compounds of formula 28.

Scheme 8

As outlined in Scheme 8, compounds of formula 10 when treated with compounds of formula 32, wherein X is chloro, bromo, or iodo, J is -O- or -S-, and X_{16} - X_{19} , L_3 , and Ar_5 are as defined for compounds of formula (IV) in the presence of sodium hydride in DMF will provide compounds of formula 33. Compounds of formula 33 when treated with aqueous hydrochloric acid in acetone or with palladium on carbon in methanol will provide compounds of formula 34 which are representative of compounds of the invention wherein A is $-Ar_4-L_3-Ar_5$.

Scheme 9

As outlined in Scheme 9, compounds of formula 4 when treated with compounds of formula 35 and a reducing agent such as but not limited to sodium triacetoxyborohydride will provide compounds of formula 36. Typical conditions for this transformation include stirring the compound of formula 4 and compound of formula 35 in a solvent such as THF in the presence of glacial acetic acid and/or magnesium sulfate followed by the addition of the reducing agent. Alternatively, compounds of formula 37, which can be obtained from the reductive amination of compounds of formula 4 with amine of formula R_a-NH_2 , may be further treated with compounds of formula $A-X_z$ (compound 11a) wherein A is as defined in formula (I) and X_z is halo or -OTf in the presence of a palladium catalyst such as but not limited to palladium tetrakis(triphenylphosphine) and a base such as but not limited to sodium carbonate will also provide compounds of formula 36 which are representative of compounds of the invention, wherein L_1 is $-NR_a-$ in compounds of formula (I).

Scheme 10

As outlined in Scheme 10, compounds of formula 38, wherein Ar_2 , E_2 , and D_2 are as defined for compounds of formula (III), when treated with compounds of formula 39, copper(II) oxide, and a base like cesium carbonate heated in solvent such as DMF supplies compounds of formula 40. Treatment of compounds of formula 41 with a base such as potassium t-butoxide in a solvent like dimethyl sulfoxide or tetrahydrofuran, then reacting with compounds of formula 40, and subsequent treatment with a hydrochloric acid in acetone provides compounds of formula 42. Alternatively, compounds of formula 42 can be prepared from compounds of formula 43 by treatment with compounds of formula 39 in the presence of ferric acetylacetonate, copper(II) oxide, a base like cesium carbonate and heated in a solvent like DMF.

Scheme 11

As outlined in Scheme 11, esters of formula 44, wherein Ar_2 is defined for

compounds of formula (III) and X is halogen, when treated with a base such as sodium hydroxide, potassium hydroxide or lithium hydroxide in a solvent such as a mixture of water and ethanol at a temperature in the range of 25 to 40 °C for 30 minutes to 2 hours provides compounds of formula 45. Compounds of formula 45
5 can be coupled with compounds of formula 46 under amide bond forming conditions familiar to one skilled in the art to give compounds of formula 47. For example, compounds of formula 45 can be combined with compounds of formula 46, hydroxybenzotriazole, dimethylaminopyridine, and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride in a solvent, such as pyridine, to supply compounds
10 of formula 47. Alternatively, compounds of formula 45 can be converted to the corresponding acid chloride by reacting in neat thionyl chloride. The acid chlorides can then be reacted with compounds of formula 46 in the presence of a base, such as triethylamine, in dichloromethane at or near room temperature to provide compounds of formula 47. Compounds of formula 47 can be converted to compounds of formula
15 48 using the conditions described in Scheme 3.

In addition, compounds of formula (I) may be converted to compounds of formula (VII) wherein the azaadamantane exists as an N-oxide by treatment with an oxidizing agent. Examples of the oxidizing agent include, but not limited to, aqueous
20 hydrogen peroxide and m-chloroperbenzoic acid. The reaction is generally performed in a solvent such as, but not limited to, acetonitrile, water, dichloromethane, acetone or mixture thereof, preferably a mixture of acetonitrile and water, at a temperature from about 0 °C to about 80 °C, for a period of about 1 hour to about 4 days.

The compounds and intermediates of the invention may be isolated and
25 purified by methods well-known to those skilled in the art of organic synthesis. Examples of conventional methods for isolating and purifying compounds can include, but are not limited to, chromatography on solid supports such as silica gel, alumina, or silica derivatized with alkylsilane groups, by recrystallization at high or low temperature with an optional pretreatment with activated carbon, thin-layer
30 chromatography, distillation at various pressures, sublimation under vacuum, and trituration, as described for instance in "Vogel's Textbook of Practical Organic Chemistry", 5th edition (1989), by Furniss, Hannaford, Smith, and Tatchell, pub. Longman Scientific & Technical, Essex CM20 2JE, England.

The compounds of the invention have at least one basic nitrogen whereby the compound can be treated with an acid to form a desired salt. For example, a compound may be reacted with an acid to provide the desired salt. The salt may be collected by any suitable means. Examples of acids suitable for the reaction include, but are not limited to tartaric acid, lactic acid, succinic acid, as well as mandelic, atrolactic, methanesulfonic, ethanesulfonic, toluenesulfonic, naphthalenesulfonic, carbonic, fumaric, gluconic, acetic, propionic, salicylic, hydrochloric, hydrobromic, phosphoric, sulfuric, citric, or hydroxybutyric acid, camphorsulfonic, malic, phenylacetic, aspartic, glutamic, and the like. Preferred salts can include, but are not limited to, p-toluenesulfonate, L-bitartrate, dihydrogen phosphate, bisuccinate, hydrochloride, dihydrogen citrate, and monohydrogen citrate. Citrate salts are more preferred.

The compounds of the invention and processes for making compounds for the method of the invention will be better understood by reference to the following Examples, which are intended as an illustration of and not a limitation upon the scope of the invention.

EXAMPLES

Method A: Etherification

A solution of 1-azaadamantan-4-ol *N*-borane complex (1 eq.) and a heteroaryl halide (1.1 eq.) in anhydrous DMF (0.5-1 M) was chilled to between -20 and 0 °C and treated with sodium hydride (1.5 equiv; 95%, Aldrich). After 15 minutes, the cooling bath was removed and the mixture was allowed to warm to room temperature. When 1-azaadamantan-4-ol *N*-borane complex was consumed as determined by TLC analysis (generally 1-2 hours), the mixture was diluted with water and stirred for 1 hour. The resulting solid product was collected by filtration, washed with water, and dried under reduced pressure to afford the desired product.

Method B: Etherification

A solution of 1-azaadamantan-4-ol (or 1-azaadamantan-4-ol *N*-borane complex, 1 eq.) and a heteroaryl halide (1.1 eq.) in anhydrous tetrahydrofuran (~0.5 M) was chilled to 0 °C under a nitrogen atmosphere and treated with potassium *tert*-butoxide in THF (1.0 M; 1 eq.; Aldrich), added dropwise. The ice bath was removed,

and the mixture was allowed to warm to room temperature overnight. After diluting with water, the mixture was extracted with chloroform (3×), and the combined extracts were purified by flash chromatography (silica gel eluting with a gradient of 5-10% MeOH-CHCl₃ containing 1% NH₄OH) to afford the desired product.

5

Method C: Acidic Deboronation

A suspension of the 1-azaadamantane *N*-borane complex (1 eq.) in acetone (~0.5 M) was chilled to 0 °C and treated with 3 N HCl (4 eq.). After 15 minutes, the ice bath was removed and the mixture was stirred until the borane complex was consumed as monitored by TLC (the borane complexes can be visualized with basic KMnO₄ stain). The pH of the solution was then adjusted with 5 N NaOH to ~ pH 10, extracted with chloroform (3×), and dried over anhydrous magnesium sulfate, filtered, and concentrated under reduced pressure. The resulting material was purified by either flash chromatography [Analogix pre-packed silica gel cartridges, 5-50% gradient of ammonium hydroxide-methanol-chloroform (2:20:78) in chloroform] or by preparative HPLC [Waters® XTerra RP18 column, 5μ, 30×100 mm, flow rate 40 mL/minute, 5-95% gradient over 22 minutes of acetonitrile in buffer (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide)] to afford the desired product as its free base. (Stotter, P. L.; Friedman, M. D.; Dorsey, G. O.; Shuely, R. W.; Williams, R. F.; Minter, D. E. *Heterocycles* 1987, 25, 251).

20

Method D: Pd/C-Catalyzed Deboronation

A solution of the 1-azaadamantane *N*-borane complex in methanol was treated with 10% palladium on carbon (~10% by weight; Aldrich) until the starting material was consumed as indicated by TLC or HPLC (generally overnight). In some instances, the solution was warmed briefly to 50 °C to accelerate the reaction. The catalyst was removed by filtration and the product was purified by either flash chromatography [Analogix pre-packed silica gel cartridges, 5-50% gradient of ammonium hydroxide-methanol-chloroform (2:20:78) in chloroform] or by preparative HPLC [Waters® XTerra RP18 column, 5μ, 30×100 mm, flow rate 40 mL/minute, 5-95% gradient over 22 minutes of acetonitrile in buffer (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide)] to afford the desired product.

30

Method E. Suzuki Coupling

A flask with a septum cap was charged with the azaadamantane containing heteroaryl halide (1 eq.), a heteroaryl-boronic acid or heteroaryl-boronate ester (2 eq.), potassium carbonate (4 eq.), and tetrakis(triphenylphosphine)-palladium(0) (0.04 eq.; Strem). The flask was stoppered, evacuated, flushed with nitrogen, and charged with the solvent mixture 1,4-dioxane-water (3:1; ~ 0.1 M of the halide), added through the septum. The mixture was then warmed to 90 °C for 3-8 hours. Upon completion of the reaction, the mixture was diluted with EtOAc, washed with water, the extracts dried over magnesium sulfate and filtered. The resulting material was purified by preparative HPLC [Waters® XTerra RP18 column, 5 μ , 30×100 mm, flow rate 40 mL/minute, 5-95% gradient of acetonitrile in buffer (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide), with UV detection at 254 nm]. Fractions containing the desired product were pooled, concentrated under vacuum, diluted with methanol or ethyl acetate, and filtered to afford the desired product.

Method F. Anhydrous Suzuki Coupling

A flask with a septum cap was charged with the heteroaryl halide (1 eq.), a heteroaryl-boronic acid or heteroaryl-boronate ester (2 eq.), potassium carbonate (3 eq.), [1,1'-bis(diphenylphosphino)ferrocene]dichloropalladium(II) complex with CH₂Cl₂ (0.2 eq.; Aldrich) and anhydrous 1,4-dioxane-ethanol (1:1; ~ 0.1 M of the halide). The mixture was flushed with nitrogen and warmed to 90 °C for 2 hours. After cooling, the mixture was concentrated and purified by preparative HPLC [Waters® XTerra RP18 column, 5 μ , 30×100 mm, flow rate 40 mL/minute, 5-95% gradient of acetonitrile in buffer (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide), with UV detection at 254 nm]. Fractions containing the desired product were pooled, concentrated under vacuum, diluted with methanol or ethyl acetate, and filtered to afford the desired product as a free base.

Method G. Microwave Suzuki Coupling

In a microwave reaction tube were combined the heteroaryl halide (~0.1 mmol), the heteroaryl-boronic acid or heteroaryl-boronate ester (3 eq.),

bis(triphenylphosphine)-palladium(II) chloride (0.1 eq.; Aldrich), and biphenyl-2-ylidicyclohexylphosphane (0.03 eq.; Strem), followed by the solvents 1,4-dioxane (1.0 mL), ethanol (1.0 mL), and aqueous sodium carbonate (1.0 M; 1.0 mL). The tube was sealed, and the reaction was heated to 150 °C at 300 W for 10 minutes in a microwave reactor. After cooling to room temperature, the mixture was diluted with 5% Na₂CO₃ and extracted with CHCl₃ (3×). The combined organic extracts were washed with brine, dried (Na₂SO₄), filtered and concentrated under reduced pressure, and the resulting material was purified by preparative HPLC [Waters® XTerra RP18 column, 5 μ, 30×100 mm, flow rate 40 mL/minute, 5-95% gradient of acetonitrile in buffer (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide)] to afford the product as its free base. Alternatively, the product was purified by preparative HPLC under acidic conditions [Waters® XTerra RP18 column, 5 μ, 30×100 mm, flow rate 40 mL/minute, 5-50% gradient of acetonitrile in 0.1% aq. TFA] to afford the trifluoroacetate salt.

Method H. Salt Formation

A rapidly stirring solution of the free base in ethyl acetate-ethanol, ethanol, or dioxane was treated with either *p*-toluenesulfonic acid monohydrate (1 eq.; Aldrich; added as a solution in ethyl acetate) or fumaric acid (1 eq., Aldrich; added as a solution in methanol) or HCl-dioxane (1-2 eq.; 4 M; Aldrich) at room temperature. After stirring for 2-16 hours, the precipitate was collected by filtration, rinsed with ethyl acetate, and dried to afford the title compound.

Method I: Etherification

A solution of 1-azaadamantan-4-ol (or 1-azaadamantan-4-ol *N*-borane complex, 1 eq.) and potassium *tert*-butoxide (1.1 eq.) in anhydrous dimethyl sulfoxide (~0.5 M) was stirred at room temperature for 1 hour. A heteroaryl halide (2.2 eq.) was added and the reaction mixture was stirred at room temperature overnight. The reaction mixture was purified by preparative HPLC on a Waters Nova-Pak® HR C18 6 μm 60Å Prep-Pak® cartridge column (40 × 100 mm) using a gradient of 10% to 100% acetonitrile in 10 mM aqueous ammonium acetate over 12 minutes at a flow rate of 70 mL/minute to provide the desired compound.

Method J: Acidic Deboronation and Hydrochloride salt isolation

A suspension of the 1-azaadamantane *N*-borane complex (1 eq.) in acetone (~0.5 M) was chilled to 0 °C and treated with 3 N HCl (5-10 eq.). After 15 minutes, the ice bath was removed and the mixture was stirred until the borane complex was consumed as monitored by TLC (the borane complexes can be visualized with basic KMnO₄ stain). The reaction mixture was concentrated under reduced pressure. The resulting material was dissolved in MeOH (~0.1 M) and stirred for 30 minutes at room temperature. The reaction mixture was concentrated again. The residue was dissolved in a minimal amount of MeOH, then triturate by the slow addition of diethyl ether/MeOH 9:1 to afford the desired product as powder. The product was isolated by filtration, washed with additional diethyl ether and dried in a vacuum oven overnight.

Method K. Suzuki Coupling

A flask with a septum cap was charged with the azaadamantane-containing heteroaryl halide (1 eq.), a heteroaryl-boronic acid or heteroaryl-boronate ester (1.2-2.0 eq.), cesium carbonate (2.5 eq.), and dichlorobis(triphenylphosphine)-palladium(II) (0.05 eq.). The flask was stoppered, evacuated, flushed with nitrogen, and charged with DMF (~ 0.1 M of the halide), added through the septum. The mixture was then warmed to 65 °C for 18 hours. Upon completion of the reaction, the mixture was diluted with ethyl acetate, washed with water, and the extracts were dried over sodium sulfate and filtered. The resulting material was purified by preparative HPLC on a Waters Nova-Pak® HR C18 6 µm 60Å Prep-Pak® cartridge column (40×100 mm) using a gradient of 10% to 100% acetonitrile in 10 mM aqueous ammonium acetate over 12 minutes at a flow rate of 70 mL/minute to provide the desired compound.

Method L: Removal of Acid Labile Protecting Groups

A mixture of the compound with an acid labile protecting group (e.g. trityl) (1 eq.) in acetone (~0.5 M) was chilled to 0 °C and treated with 3 N HCl (4 eq.). After 15 minutes, the ice bath was removed and the mixture was stirred until the protecting group has cleaved as monitored by TLC. The pH of the solution was then adjusted with 5 N NaOH to ~ pH 10, extracted with chloroform (3×), and dried over anhydrous magnesium sulfate, filtered, and concentrated under reduced pressure. The resulting

material was purified by either flash chromatography [Analogix pre-packed silica gel cartridges, 5-50% gradient of ammonium hydroxide-methanol-chloroform (2:20:78) in chloroform] or by preparative HPLC [Waters® XTerra RP18 column, 5 μ , 30 $\times$ 100 mm, flow rate 40 mL/min, 5-95% gradient over 22 minutes of acetonitrile in buffer
5 (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide)] to afford the desired product as its free base.

1-Azaadamantan-4-ol N-borane complex.

A solution of 1-azaadamantan-4-one (29 g, 190 mmol; see Becker, D. P.; Flynn, D. L. *Synthesis* **1992**, 1080) in anhydrous tetrahydrofuran (200 mL) was
10 chilled in an ice-water bath and treated with borane-THF complex (1.0 M in THF; 200 mL, 200 mmol; Aldrich), added dropwise. After stirring for 30 minutes, the mixture was diluted with methanol (1000 mL) and carefully treated with sodium borohydride (8.8 g, 230 mmol; Aldrich), keeping the internal temperature about 5-7 °C. The mixture was stirred for 2 hours, and then the ice bath was removed and
15 stirring was continued for 4 hours. The volatile components were removed on the rotary evaporator and the residue was dissolved in chloroform (~500 mL) and washed with saturated aqueous sodium carbonate. The aqueous layer was extracted with chloroform and the organic phases were dried over magnesium sulfate and filtered. The resulting material was purified by flash chromatography (Analogix 400 g 65×220
20 mm silica gel column, 5-95% gradient of ethyl acetate in hexanes over 50 minutes) to afford an inseparable 3.7:1.0 mixture of isomers [according to integration of ¹H NMR signals (chloroform-D) at δ3.96 (t, major) and δ3.82 (t, minor)] (33 g, 200 mmol; 100% yield). The product spot can be visualized on the TLC plate (silica gel) using KMnO₄ stain.

Example 21A

(4*s*)-4-(Thiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane

A solution of the product of Example 20B (93 mg, 0.30 mmol) in ethanol (3 mL) was treated with 10% Pd/C (10 mg; Aldrich) under a hydrogen balloon with vigorous stirring for 7 hours. The mixture was filtered to remove the catalyst, rinsing with methanol. The compound was purified by preparative HPLC [Waters® XTerra RP18 5 μ column, 30×100 mm, flow rate 40 mL/minute, 5-95% gradient of acetonitrile in buffer (0.1 M aqueous ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide) over 22 minutes, with UV detection at 254 nm]. Fractions containing the desired product were pooled and concentrated under vacuum to afford the title compound: ¹H NMR (300 MHz, methanol-D₄) δ ppm 1.68 (s, 1 H), 1.87 (d, *J*=11.9 Hz, 2 H), 2.18 (s, 2 H), 2.27 (d, *J*=12.9 Hz, 2 H), 3.04 - 3.17 (m, 6 H), 5.16 (t, *J*=3.4 Hz, 1 H), 6.88 (d, *J*=3.7 Hz, 1 H), 7.12 (d, *J*=3.7 Hz, 1 H). 25

A solution of azaadamantan-4-one (29 g, 190 mmol, see Becker, D. P.; Flynn, D. L. Synthesis, 1992, 1080) in anhydrous tetrahydrofuran (200 mL) was chilled in an ice-water bath and treated with borane-THF complex (1.0 M in THF; 200 mL, 200 mmol; Aldrich), added dropwise. After stirring for 30 minutes, the reaction mixture was diluted with methanol (1000 mL) and carefully treated with sodium borohydride (8.8 g, 230 mmol; Aldrich), keeping the internal temperature about 5-7 °C. The reaction was stirred for 2 hours, and then the ice bath was removed and stirring was continued for 4 hours. The volatile components were removed on the rotary evaporator and the residue was dissolved in chloroform (~500 mL) and washed with

30

saturated aqueous sodium carbonate. The aqueous layer was extracted with chloroform and the organic phases were dried over magnesium sulfate. The resulting material was purified by flash chromatography (Analogix 400 g 65×220 mm silica gel column, 5-95% gradient of ethyl acetate in hexanes over 50 minutes) to afford an inseparable 3.7 : 1.0 mixture of isomers [according to integration of ¹H NMR signals (CDCl₃) at δ3.96 (t, major) and δ3.82 (t, minor)]. The product spot can be visualized on the TLC plate (silica gel) using KMnO₄ stain.

(4s)-4-(5-Phenyl-[1,3,4]thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane N-borane complex

30

A solution of (4s)-1-azatricyclo[3.3.1.1^{3,7}]decan-4-ol N-borane complex (Example 43D, 2.31 g, 13.8 mmol) and 2-chloro-5-phenyl-[1,3,4]thiadiazole (Example 43E, 2.78 g, 14.1 mmol) in anhydrous DMF (20 mL) was chilled to 0 °C

and treated with sodium hydride (500 mg, 20.8 mmol; Aldrich, 95%). Vigorous bubbling was observed, and the solution turned orange. After 15 minutes, the cooling bath was removed and the reaction was stirred for 4 hours. The reaction mixture was diluted with water and stirred overnight. The resulting precipitate was collected by filtration, washed with water, and dried under vacuum to afford the title product: ¹H NMR (300 MHz, CDCl₃) δ ppm 1.73 (d, *J*=12.5 Hz, 2 H), 2.04 (s, 1 H), 2.22 (d, *J*=13.2 Hz, 2 H), 2.54 (s, 2 H), 3.17 - 3.28 (m, 6 H), 5.38 (t, *J*=3.6 Hz, 1 H), 7.42 - 7.51 (m, 3 H), 7.77 - 7.87 (m, 2 H). (4*s*)-4-(5-Phenyl-[1,3,4]thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane (A-913958.0)

A suspension of (4*s*)-4-(5-phenyl-[1,3,4]thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane N-borane complex (Example 43F, 580 mg, 1.77 mmol) in acetone (18 mL) was chilled to 0 °C and treated with 3 N HCl (6 mL). The suspension slowly cleared, and then a precipitate began to form. After 20 minutes, the ice bath was removed and the mixture was stirred for 2 hours. The solution was then basified with 5 N NaOH to pH 10, extracted with chloroform (3×), and dried over anhydrous magnesium sulfate. The resulting material was purified by flash chromatography [Analogix 34 g 25 mm silica gel column, 5-50% gradient of ammonium hydroxide-methanol-chloroform (2:20:78) in chloroform]. It was purified further by preparative HPLC [Waters XTerra RP18 5μ column, 30×100 mm, flow rate 40 mL/min, 5-95% gradient of acetonitrile in buffer (0.1 M ammonium bicarbonate, adjusted to pH 10 with ammonium hydroxide) over 22 minutes, with UV detection at 254 nm]. Fractions containing the desired product (center of peak only) were pooled and concentrated to afford the title product: ¹H NMR (300 MHz, methanol-d₄) δ ppm 1.71 (s, 1 H), 1.92 (d, *J*=12.5 Hz, 2 H), 2.29 (s, 4 H), 3.10 - 3.21 (m, 4 H), 3.30 - 3.38 (m, 2 H), 5.35 (t, *J*=3.1 Hz, 1 H), 7.46 - 7.54 (m, 3 H), 7.80 - 7.89 (m, 2 H). (4r)-4-N-(6-Chloropyridin-3-yl)-1-azatricyclo[3.3.1.1^{3,7}]decan-4-amine

A solution of 1-azatricyclo[3.3.1.1^{3,7}]decan-4-one (1.51 g, 10 mmol; see

Becker, D. P.; Flynn, D. L. *Synthesis* **1992**, 1080) in HOAc (50 mL) was treated with 3-amino-6-chloropyridine (1.90 g, 15 mmol; Aldrich), anhydrous Na₂SO₄ (18.5 g, 0.13 mol; Aldrich), and NaBH(OAc)₃ (4.22 g, 20 mmol; Aldrich) and was stirred at ambient temperature for 10 hours. After the reaction was complete, the solid was
 5 filtered off, and the filtrate was concentrated. The residue was carefully basified with saturated aqueous Na₂CO₃ (pH 10), extracted with CHCl₃ (3×100 mL), and the combined extracts were purified by flash chromatography [silica gel, ammonium hydroxide-methanol-chloroform (2:10:90)] to afford the title compounds:

6-Chloropicolinic acid (0.50 g, 3.17 mmol) was dissolved in thionyl chloride (5.0 mL) and stirred at 25 °C for 1 hour. The thionyl chloride was evaporated, and 4-aminopyridine (0.28 g, 2.98 mmol), triethylamine (0.415 mL, 2.98 mmol) and

dichloromethane (50 mL) were added. The solution was stirred at 25 °C for 18 hours. The reaction mixture was partitioned between dichloromethane (50 mL) and saturated sodium bicarbonate solution (100 mL). The organic layer was dried (sodium sulfate) and concentrated, and the residue was purified by silica gel flash column

Example 149B

(4s)-4-[(4-Chloro-1,3-thiazol-2-yl)oxy]-1-azatricyclo[3.3.1.^{3,7}]decane

The free base was prepared from the product of Example 149A (80 mg, 0.281 mmol) according to Method C. The resulting material was taken up in 3 N HCl, was concentrated to dryness and stirred in 10:1 diethyl ether/MeOH. The precipitate was filtered and dried under vacuum to afford the titled compound as a hydrochloride salt:

¹H NMR (500 MHz, methanol-D₄) δ ppm 1.91 - 2.02 (m, 2 H), 2.20 (br s, 1 H), 2.24 - 2.33 (m, 2 H), 2.63 (br s, 2 H), 3.57 (br s, 2 H), 3.61 - 3.81 (m, 4 H), 5.37 (t, *J*=3.2 Hz, 1 H), 6.80 (s, 1 H). Example 150(4s)-4-[[4-(1H-Pyrazol-4-yl)-1,3-thiazol-2-yl]oxy]-1-azatricyclo[3.3.1.^{3,7}]decane

In a sealed tube were combined the product of Example 147A (50 mg, 0.152 mmol), 4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1-*tert*-butyl-1H-pyrazole (86 mg, 0.198 mmol; JP 2005232071), bis(triphenylphosphine)-palladium(II) chloride (5.3 mg, 7.60 μmol), cesium carbonate (121 mg, 0.371 mmol), and DMF (1.5 mL). The tube was heated at 65 °C for 6 hours. After cooling to room temperature, the mixture was partitioned between ethyl acetate (3 × 10 mL) and water (100 mL). The combined organic extracts were washed with brine (100 mL), dried (sodium sulfate) and concentrated under reduced pressure. The residue was purified by silica gel flash chromatography to provide the *tert*-butyl protected N-borane complex as a white solid. The solid was then processed as described in Method L to provide the free base. It was then reacted with *p*-toluenesulfonic acid monohydrate according to Method H to provide the titled compound as a bistosylate: ¹H NMR (400 MHz, methanol-D₄) δ ppm 1.91 - 2.01 (m, 2 H), 2.20 (br s, 1 H), 2.27 - 2.34 (m, 2 H), 2.36 (s, 6 H; TsOH), 2.68 (br s, 2 H), 3.58 (br s, 2 H), 3.63 - 3.77 (m, 4 H), 5.46 (t, *J*=3.4 Hz, 1 H), 7.13 (s, 1 H), 7.22 (d, *J*=8.0 Hz, 4 H; TsOH), 7.70 (d, *J*=8.3 Hz, 4 H; TsOH), 8.35 (s, 2 H). Example 151(4s)-4-[(4-Phenyl-1,3-thiazol-2-yl)oxy]-1-azatricyclo[3.3.1.1^{3,7}]decane

To a solution of the product of Example 147A (71 mg, 0.216 mmol) in 2-propanol (3.0 mL) and water (1.0 mL) were added phenylboronic acid (34.2 mg, 0.280 mmol), bis(triphenylphosphine)-palladium(II) chloride (6.1 mg, 8.6 μ mol) and aqueous sodium carbonate (2.5M, 0.54 mL). The reaction mixture was degassed with nitrogen and then heated with stirring at 90 °C for 2 hours. After cooling to room temperature, the reaction mixture was diluted with ethyl acetate (5.0 mL), passed through a glass microfiber frit, concentrated and purified by silica gel flash chromatography to provide the N-borane complex. It was then processed as described in Method C. The resulting material was taken into 3 N HCl, was concentrated to dryness and stirred in 10:1 diethyl ether/MeOH. The precipitate was filtered and dried under vacuum to afford the titled compound as hydrochloride salt: ¹H NMR (500 MHz, methanol-D₄) δ ppm 1.93 - 2.03 (m, 2 H), 2.22 (br s, 1 H), 2.31 - 2.41 (m, 2 H), 2.73 (br s, 2 H), 3.59 (br s, 2 H), 3.67 - 3.77 (m, 4 H), 5.51 (t, $J=3.2$ Hz, 1 H), 7.20 (s, 1 H), 7.27 - 7.32 (m, 1 H), 7.33 - 7.47 (m, 2 H), 7.77 - 7.90 (m, 2 H). Example 159(4s)-N-Pyridin-3-yl-1-azatricyclo[3.3.1.1^{3,7}]decan-4-amine bis(4-methylbenzenesulfonate) hemihydrate

Pyridine-3-amine (143 mg, 1.52 mmol) was added to a solution of 1-azatricyclo[3.3.1.1^{3,7}]decan-4-one (151 mg, 1.00 mmol) in acetic acid (5 mL). Anhydrous sodium sulfate (1.82 g, 12.8 mmol) was added, and the mixture was stirred at room temperature. After 10 minutes, sodium triacetoxyborohydride (412 mg, 1.94 mmol) was added and the mixture was stirred at room temperature for 10 hours. The reaction mixture was filtered through diatomaceous earth with a chloroform (5 mL) rinse. The filtrate was concentrated under vacuum, and the residue was purified by flash chromatography on silica (eluted with chloroform-methanol-concentrated ammonium hydroxide, 90:10:1) to provide a colorless gum. This was combined with 4-methylbenzenesulfonic acid monohydrate (29 mg) in a boiling mixture of ethyl acetate (5 mL) and EtOH (0.5 mL) and cooled to room temperature. After 30 hours, the product was collected by filtration, washed with ethyl acetate (2 mL) and dried under vacuum to provide the titled compound: ¹H NMR (300 MHz, methanol-D₄) δ 1.91 - 2.00 (m, 3 H), 2.14 - 2.33 (m, 5 H), 2.36 (s, 6 H), 3.57 (s, 2 H), 3.69 (s, 4 H), 4.03 (s, 1 H), 7.23 (d, *J*=7.9 Hz, 4 H), 7.70 (d, *J*=8.3

(4s)-N-(5-Bromo-6-chloropyridin-3-yl)-1-azatricyclo[3.3.1.1^{3,7}]decan-4-amine 4-methylbenzenesulfonate

10 Magnesium sulfate (1.80 g, 15 mmol) and 5-bromo-6-chloropyridin-3-amine (310 mg, 1.49 mmol) were added to a solution of 1-azatricyclo[3.3.1.1^{3,7}]decan-4-one (151 mg, 1.00 mmol) in acetic acid (5 mL). The resulting suspension was stirred for 10 minutes, then sodium triacetoxyborohydride (412 mg, 1.94 mmol) was added. The mixture was stirred at room temperature for 14 hours, then concentrated under
15 vacuum to dryness. The white solid residue was slurried in ethyl acetate (3 mL), applied to the top of a silica column and eluted with chloroform-methanol-concentrated ammonium hydroxide (90:10:1) to provide a pink solid. This material was heated with ethyl acetate (3 mL) and a solution of 4-methylbenzenesulfonic acid monohydrate (40 mg, 1 eq.) in warm ethyl acetate (1 mL) was added. Additional
20 ethyl acetate (3 mL) and EtOH (3 mL) were added with heating to bring the mixture to homogeneity. After cooling to room temperature and finally to -10 °C, the mixture was filtered and the collected solid was washed with ethyl acetate (3 mL) and dried under vacuum to provide the titled compound: ¹H NMR (300 MHz, methanol-D₄) δ 1.91 (br d, $J=13.1$ Hz, 2 H), 2.11 - 2.21 (m, 1 H), 2.22 - 2.32 (m, 4 H), 2.36 (s, 3 H),

(4*s*)-N-[6-(1-Benzenesulfonyl-1*H*-indol-3-yl)pyridin-3-yl]-1-azatricyclo[3.3.1.1^{3,7}]decan-4-amine

15 Prepared from the product of Example 65A (150 mg, 0.569 mmol) and 1-phenylsulfonyl-1*H*-indol-3-ylboronic acid (350 mg, 1.2 mmol; Aldrich) according to Method E: MS (DCI/ NH_3) $m/z=485$ ($\text{M}+\text{H}$) $^+$.

Example 162B

20 (4*s*)-N-[6-(1*H*-indol-3-yl)pyridin-3-yl]-1-azatricyclo[3.3.1.1^{3,7}]decan-4-amine

A solution of the product of Example 162A (50 mg, 0.103 mmol) and potassium carbonate (34 mg, 0.25 mmol) in methanol (3 mL) was heated to reflux for 90 minutes. After cooling, the solvent was removed, the residue was dissolved in water, and the mixture was extracted with ethyl acetate (3 $\times$). The combined extracts were washed with brine, dried (Na_2SO_4), filtered and concentrated to afford the free base of the title compound: ^1H NMR (300 MHz, methanol- D_4) δ ppm 1.68 (s, 1 H), 1.86 (d, $J=14.9$ Hz, 2 H), 1.96 (s, 2 H), 2.29 (d, $J=12.2$ Hz, 2 H), 3.09 - 3.29 (m, 8 H), 3.81 (s, 1 H), 7.01 - 7.24 (m, 3 H), 7.40 (d, $J=7.1$ Hz, 1 H), 7.50 - 7.61 (m, 2 H), 7.98 (d, $J=7.5$ Hz, 1 H), 8.07 (d, $J=2.4$ Hz, 1 H). MS (DCI/ NH_3) $m/z=345$ ($\text{M}+\text{H}$) $^+$.

Compositions of the Invention

The invention also provides pharmaceutical compositions comprising a therapeutically effective amount of a compound of formula (I) in combination with a

pharmaceutically acceptable carrier. The compositions comprise compounds of the invention formulated together with one or more non-toxic pharmaceutically acceptable carriers. The pharmaceutical compositions can be formulated for oral administration in solid or liquid form, for parenteral injection or for rectal administration.

The term "pharmaceutically acceptable carrier," as used herein, means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols; such a propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of one skilled in the art of formulations.

The pharmaceutical compositions of this invention can be administered to humans and other mammals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments or drops), buccally or as an oral or nasal spray. The term "parenterally," as used herein, refers to modes of administration, including intravenous, intramuscular, intraperitoneal, intrasternal, subcutaneous, intraarticular injection and infusion.

Pharmaceutical compositions for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (propylene glycol, polyethylene glycol, glycerol, and the like, and suitable mixtures thereof), vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate, or suitable

mixtures thereof. Suitable fluidity of the composition may be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

These compositions can also contain adjuvants such as preservative agents, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of microorganisms can be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It also can be desirable to include isotonic agents, for example, sugars, sodium chloride and the like. Prolonged absorption of the injectable pharmaceutical form can be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This can be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug can depend upon its rate of dissolution, which, in turn, may depend upon crystal size and crystalline form. Alternatively, a parenterally administered drug form can be administered by dissolving or suspending the drug in an oil vehicle.

Suspensions, in addition to the active compounds, can contain suspending agents, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, tragacanth, and mixtures thereof.

If desired, and for more effective distribution, the compounds of the invention can be incorporated into slow-release or targeted-delivery systems such as polymer matrices, liposomes, and microspheres. They may be sterilized, for example, by filtration through a bacteria-retaining filter or by incorporation of sterilizing agents in the form of sterile solid compositions, which may be dissolved in sterile water or some other sterile injectable medium immediately before use.

Injectable depot forms are made by forming microencapsulated matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations also are prepared by entrapping the drug in liposomes or microemulsions which are

compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other
5 sterile injectable medium just prior to use.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions can be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation also can be a sterile injectable solution, suspension or emulsion in a nontoxic, parenterally
10 acceptable diluent or solvent such as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that can be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In
15 addition, fatty acids such as oleic acid are used in the preparation of injectables.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, one or more compounds of the invention is mixed with at least one inert pharmaceutically acceptable carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches,
20 lactose, sucrose, glucose, mannitol, and salicylic acid; b) binders such as carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia; c) humectants such as glycerol; d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate; e) solution retarding agents such as paraffin; f) absorption accelerators
25 such as quaternary ammonium compounds; g) wetting agents such as cetyl alcohol and glycerol monostearate; h) absorbents such as kaolin and bentonite clay; and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

30 Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using lactose or milk sugar as well as high molecular weight polyethylene glycols.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well-

known in the pharmaceutical formulating art. They can optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract in a delayed manner.

Examples of materials useful for delaying release of the active agent can include

5 polymeric substances and waxes.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore
10 melt in the rectum or vaginal cavity and release the active compound.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing
15 agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

20 Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays,
25 inhalants or patches. A desired compound of the invention is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, eardrops, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

30 The ointments, pastes, creams and gels may contain, in addition to an active compound of this invention, animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

Powders and sprays can contain, in addition to the compounds of this

invention, lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

Compounds of the invention also can be administered in the form of
5 liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals that are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes may be used. The present compositions in liposome form may contain, in
10 addition to the compounds of the invention, stabilizers, preservatives, and the like. The preferred lipids are the natural and synthetic phospholipids and phosphatidylcholines (lecithins) used separately or together.

Methods to form liposomes are known in the art. See, for example, Prescott, Ed., Methods in Cell Biology, Volume XIV, Academic Press, New York, N. Y.,
15 (1976), p 33 et seq.

Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers or propellants. Ophthalmic formulations, eye ointments,
20 powders and solutions are also contemplated as being within the scope of this invention. Aqueous liquid compositions of the invention also are particularly useful.

The compounds of the invention can be used in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact
25 with the tissues of humans and lower animals without undue toxicity, irritation, allergic response, and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well-known in the art. The salts can be prepared in situ during the final isolation and purification of the compounds of the invention or separately by reacting a free base function with a suitable organic acid.

30 Representative acid addition salts can be prepared using various suitable acids for example, including, but are not limited to, acetic, adipic, alginic, citric, aspartic, benzoic, benzenesulfonic, butyric, camphoric, camphorsulfonic, carbonic, digluconic, glycerophosphoric, heptanoic, hexanoic, fumaric, hydrochloric, hydrobromic, hydroiodic, 2-hydroxyethansulfonic (isethionic), lactic, maleic, methanesulfonic,

nicotinic, 2-naphthalenesulfonic, oxalic, pamoic, pectinic, persulfuric, 3-phenylpropionic, picric, pivalic, propionic, succinic, sulfuric, tartaric, thiocyanic, phosphoric, glutamic, p-toluenesulfonic, and undecanoic acids.

Particular examples of acids which can be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, hydrobromic acid, sulphuric acid and phosphoric acid and such organic acids as oxalic acid, maleic acid, succinic acid, tartaric acid, and citric acid.

Basic addition salts can be prepared in situ during the final isolation and purification of compounds of this invention by reacting a carboxylic acid-containing moiety with a suitable base such as the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia or an organic primary, secondary or tertiary amine. Pharmaceutically acceptable salts include, but are not limited to, cations based on alkali metals or alkaline earth metals such as lithium, sodium, potassium, calcium, magnesium, and aluminum salts, and the like, and nontoxic quaternary ammonia and amine cations including ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, diethylamine, ethylamine and the such as. Other representative organic amines useful for the formation of base addition salts include ethylenediamine, ethanolamine, diethanolamine, piperidine, and piperazine.

Also, the basic nitrogen-containing groups can be quaternized with such agents as lower alkyl halides such as methyl, ethyl, propyl, and butyl chlorides, bromides and iodides; dialkyl sulfates such as dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; arylalkyl halides such as benzyl and phenethyl bromides and others. Water or oil-soluble or dispersible products are thereby obtained.

The term "pharmaceutically acceptable prodrug" or "prodrug," as used herein, represents those prodrugs of the compounds of the invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use. Prodrugs of the invention can be rapidly transformed in vivo to a parent compound of formula (I), for example, by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, V. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers

in Drug Design, American Pharmaceutical Association and Pergamon Press (1987).

The invention also contemplates pharmaceutically acceptable compounds that when administered to a patient in need may be converted through in vivo biotransformation into compounds of formula (I).

Determination of Biological Activity

To determine the effectiveness of representative compounds of this invention as ligands for $\alpha 7$ nAChRs, the compounds of the invention were evaluated according to the [^{3} H]-methyllycaconitine (MLA) binding assay, or the [^{3} H]-DPPB binding
10 assay. To determine the effectiveness of representative compounds of this invention as ligands for $\alpha 4\beta 2$ nAChRs, the compounds of the invention were evaluated according to the [^{3} H]-cytisine binding assay, which were performed as described below.

15 [^{3} H]-Cytisine binding

Binding to the $\alpha 4\beta 2$ nAChR subtype was determined according to conditions which were modified from the procedures described in Pabreza LA, Dhawan, S, Kellar KJ, [^{3} H]-Cytisine Binding to Nicotinic Cholinergic Receptors in Brain, Mol. Pharm. 39: 9-12, 1991. Membrane enriched fractions from rat brain minus
20 cerebellum (ABS Inc., Wilmington, DE) were slowly thawed at 4 °C, washed and resuspended in 30 volumes of BSS-Tris buffer (120 mM NaCl/5 mM KCl/2 mM CaCl₂/2 mM MgCl₂/50 mM Tris-Cl, pH 7.4, 4 °C). Samples containing 100-200 μ g of protein and 0.75 nM [^{3} H]-cytisine (30 Ci/mmol; Perkin Elmer/NEN Life Science Products, Boston, MA) were incubated in a final volume of 500 μ L for 75 minutes at
25 4 °C. Seven log-dilution concentrations of each compound were tested in duplicate. Non-specific binding was determined in the presence of 10 μ M (-)-nicotine. Bound radioactivity was isolated by vacuum filtration onto prewetted glass fiber filter plates (Millipore, Bedford, MA) using a 96-well filtration apparatus (Packard Instruments, Meriden, CT) and were then rapidly rinsed with 2 mL of ice-cold BSS buffer (120
30 mM NaCl/5 mM KCl/2 mM CaCl₂/2 mM MgCl₂). Packard MicroScint-20[®] scintillation cocktail (40 μ L) was added to each well and radioactivity determined using a Packard TopCount[®] instrument. The IC₅₀ values were determined by nonlinear regression in Microsoft Excel[®] software. K_i values were calculated from

the IC_{50} s using the Cheng-Prusoff equation, where $K_i = IC_{50}/(1+[Ligand]/K_D)$.

[³H]-Methyllycaconitine (MLA) binding

Binding to the $\alpha 7$ nAChR subtype was determined according to conditions which were similar to those used for the [³H]-cytisine binding assay. Membrane enriched fractions from rat brain minus cerebellum (ABS Inc., Wilmington, DE) were slowly thawed at 4 °C, washed and resuspended in 30 volumes of BSS-Tris buffer (120 mM NaCl, 5 mM KCl, 2 mM CaCl₂, 2 mM MgCl₂, and 50 mM Tris-Cl, pH 7.4, 22 °C). Samples containing 100-200 µg of protein, 5 nM [³H]-MLA (25 Ci/mmol; Perkin Elmer/NEN Life Science Products, Boston, MA) and 0.1% bovine serum albumin (BSA, Millipore, Bedford, MA) were incubated in a final volume of 500 µL for 60 minutes at 22 °C. Seven log-dilution concentrations of each compound were tested in duplicate. Non-specific binding was determined in the presence of 10 µM MLA. Bound radioactivity was isolated by vacuum filtration onto glass fiber filter plates prewetted with 2% BSA using a 96-well filtration apparatus (Packard Instruments, Meriden, CT) and were then rapidly rinsed with 2 mL of ice-cold BSS. Packard MicroScint-20[®] scintillation cocktail (40 µL) was added to each well and radioactivity was determined using a Packard TopCount[®] instrument. The IC_{50} values were determined by nonlinear regression in Microsoft Excel[®] software. K_i values were calculated from the IC_{50} s using the Cheng-Prusoff equation, where $K_i = IC_{50}/(1+[Ligand]/K_D)$.

[³H]-DPPB binding

[³H]-DPPB, [³H]-(S,S)-2,2-dimethyl-5-(6-phenyl-pyridazin-3-yl)-5-aza-2-azonia-bicyclo[2.2.1]heptane iodide, binding to the $\alpha 7$ nAChR subtype was determined using membrane enriched fractions from rat brain minus cerebellum or human cortex (ABS Inc., Wilmington, DE). Pellets were thawed at 4°C, washed and resuspended with a Polytron at a setting of 7 in 30 volumes of BSS-Tris buffer (120 mM NaCl, 5 mM KCl, 2 mM CaCl₂, 2 mM MgCl₂, and 50 mM Tris-Cl, pH 7.4, 4°C). Seven log-dilution concentrations of test compounds containing 100-200 µg of protein, and 0.5 nM [³H]-DPPB (62.8 Ci/mmol; R46V, Abbott Labs) were incubated in a final volume of 500 µl for 75 minutes at 4°C in duplicate. Non-specific binding was determined in the presence of 10 µM methyllycaconitine. Bound radioactivity

was collected on Millipore MultiScreen® harvest plates FB presoaked with 0.3% PEI using a Packard cell harvester, washed with 2.5 ml ice-cold buffer, and radioactivity was determined using a Packard TopCount Microplate beta counter. IC₅₀ values were determined by nonlinear regression in Microsoft® Excel or Assay Explorer. K_i values were calculated from the IC₅₀s using the Cheng-Prusoff equation, where $K_i = IC_{50}/(1+[Ligand]/K_D)$. [³H]-DPPB was obtained according to the preparation procedures described below.

10 [Methyl-³H]2,2-Dimethyl-5-(6-phenyl-pyridazin-3-yl)-5-aza-2-azonia-bicyclo[2.2.1]heptane; iodide Preparation

[Methyl-³H]2,2-dimethyl-5-(6-phenyl-pyridazin-3-yl)-5-aza-2-azonia-bicyclo[2.2.1]heptane; iodide used in the [³H]-DPPB binding assay above was prepared according to the following procedures.

15 Step 1: Preparation of t-Butyl (S,S)-5-(6-Phenyl-pyridazin-3-yl)-2,5-diazabicyclo[2.2.1]heptane-2-carboxylate

Triethylamine (20 mL) was added to a suspension of t-butyl (S,S)-2,5-diazabicyclo[2.2.1]heptane-2-carboxylate (3.43 g, 17.3 mmol, Aldrich Chemical Company) and 3-chloro-6-phenylpyridazine (3.30 g, 17.3 mmol, Aldrich Chemical Company) in toluene (50 mL) and the mixture was heated under nitrogen at 100 °C for 7 days. The dark mixture was cooled to room temperature, and the resulting precipitate was isolated by filtration, washed with toluene (15 mL) and dried under vacuum to provide the title compound as an off-white solid (3.00 g). The filtrate was concentrated and the residue was purified by column chromatography on silica gel, eluting with ethyl acetate, to provide additional product (0.41 g, total yield 3.41 g, 56%): MS (DCI/NH₃) m/z 353 (M+H)⁺.

25 Step 2: Preparation of (S,S)-2-Methyl 5-(6-phenyl-pyridazin-3-yl)-2,5-diazabicyclo[2.2.1]heptane

30 The product obtained from Step 1 (3.41 g, 9.7 mmol) was dissolved in formic acid (20 mL) and treated with formalin (37% by weight, 1.0 g, 12.3 mmol). The mixture was heated at 100 °C for 1 hour, and the brown solution was cooled to room temperature and concentrated under vacuum. The residue was purified by column chromatography on silica gel, eluting with CH₂Cl₂ – CH₃OH – NH₄OH (95:5:1) to

provide the title compound as an off-white solid (2.50 g, 96%): MS (DCI/NH₃) m/z 267 (M+H)⁺.

Step 3: Preparation of [³H]-(S,S)-2,2-Dimethyl-5-(6-phenyl-pyridazin-3-yl)-5-aza-2-azonia-bicyclo[2.2.1]heptane iodide ([³H]-DPPB)

[³H]Methyl iodide in toluene (250 mCi in 0.1 mL, 85 Ci/mmol, American Radiolabeled Chemicals, Inc.) was combined with a solution of the product obtained from Step 2 in dichloromethane (0.788 mg, 2.96 μmole in 0.45 mL). The vial was capped and the mixture was allowed to react overnight at room temperature.

10 Methanol was added and the solvents were evaporated to give 42 mCi. The product was taken up in methanol for HPLC purification.

Step 4: Purification by High Performance Liquid Chromatography (HPLC)

About 7 mCi of [³H]-DPPB was evaporated to dryness and the residue was dissolved in total about 4.5 ml acetonitrile:water:TFA (15:85:0.1). Approximately 0.9 mL per injection were made onto a Phenomenex Luna C18(2) column (5 micron, 250 mm x 4.6 mm ID) using an Agilent HPLC system. [³H]-DPPB was eluted by a gradient mobile phase from 10% B to 20% B in 20 min where Mobile Phase A= 0.1% trifluoroacetic acid in water and Mobile Phase B= 0.1% trifluoroacetic acid in acetonitrile at a flow rate of approximately 1 mL/min. Peak detection and chromatograms were obtained with an Agilent variable wavelength UV detector set at 275 nm. The fractions containing [³H]-DPPB were collected at approximately 14 minutes using an Agilent fraction collector. The fractions were combined and the solvents were evaporated in vacuo. The residue was dissolved in 200 proof ethanol (2 mL) to give 0.7 mCi.

Step 5: Determination of Purity and Specific Activity

[³H]-DPPB was assayed using an Agilent 1100 series HPLC system consisting of a quaternary pump, an autosampler, and a photodiode array UV detector. A Packard Radiomatic A 500 radioactivity detector was connected to the HPLC system. For radiodetection, a 500 μL flow cell and a 3:1 ratio of Ultima-Flo M scintillation cocktail to HPLC mobile phase were used. The analyses were performed using a Phenomenex Luna C18(2) column (5 microns, 250 mm x 4.6 mm ID). The mobile

phase consisted of a gradient starting with 10% B and ramping to 20% B in 20 minutes followed by ramping to 90% B in 1 minute and hold at 90% B for 9 minutes, where Mobile Phase A = 0.1% trifluoroacetic acid in water and Mobile Phase B = 0.1% trifluoroacetic acid in acetonitrile. The flow rate was set at approximately 1 mL/min and the UV detection was set at 275 nm.

Preferred compounds of the invention had K_i values of from about 0.1 nanomolar to about 10 micromolar when tested by the [^3H]-MLA assay, many having a K_i of less than 1 micromolar. Other preferred compounds demonstrated [^3H]-Cytisine binding values of compounds of the invention ranged from about 0.1 nanomolar to at least 10 micromolar. Some preferred compounds exhibited greater potency at $\alpha 7$ receptors compared to $\alpha 4\beta 2$ receptors. The determination of such preferred compounds typically considered the K_i value as measured by MLA assay in view of the K_i value as measured by [^3H]-cytisine binding, such that in the formula $D = K_i^{^3\text{H-cytisine}} / K_{i\text{ MLA}}$, D is greater than about 50. Alternatively, the K_i value as measured by [^3H]-DPPB assay can be used in place of the $K_{i\text{ MLA}}$ such that in the formula $D' = K_i^{^3\text{H-cytisine}} / K_{i\text{ [}^3\text{H}\text{] DPPB}}$, D' is greater than about 50.

Compounds of the invention are $\alpha 7$ nAChRs ligands and/or $\alpha 4\beta 2$ ligands that modulate function of $\alpha 7$ nAChRs and/or $\alpha 4\beta 2$ ligands by altering the activity of the receptor or signaling. The compounds can be inverse agonists that inhibit the basal activity of the receptor or antagonists that completely block the action of receptor-activating agonists. The compounds also can be partial agonists that partially block or partially activate the $\alpha 7$ nAChR receptor or agonists that activate the receptor. Binding to the $\alpha 7$ nicotinic receptor also triggers key signaling processes involving various kinases and phosphatases and protein-protein interactions that are important to effects on memory, cytoprotection, gene transcription and disease modification.

Methods of the Invention

Compounds and compositions of the invention are useful for modulating the effects of nAChRs, and more particularly $\alpha 7$ nAChRs. In particular, the compounds and compositions of the invention can be used for treating and preventing disorders modulated by $\alpha 7$ nAChRs. Typically, such disorders can be ameliorated by selectively modulating the $\alpha 7$ nAChRs in a mammal, preferably by administering a compound or composition of the invention, either alone or in combination with

another active agent, for example, as part of a therapeutic regimen. Also, some compounds of the invention possess affinity at the $\alpha 4\beta 2$ nAChRs in addition to $\alpha 7$ nAChRs, and selective compounds with dual affinities at both receptor subtypes also are expected to have beneficial effects.

5 The compounds of the invention, including but not limited to those specified in the examples, possess an affinity for nAChRs, and more particularly $\alpha 7$ nAChRs. As $\alpha 7$ nAChRs ligands, the compounds of the invention can be useful for the treatment and prevention of a number of $\alpha 7$ nAChR-mediated diseases or conditions.

 For example, $\alpha 7$ nAChRs have been shown to play a significant role in
10 enhancing cognitive function, including aspects of learning, memory and attention (Levin, E.D., *J. Neurobiol.* 53: 633-640, 2002). As such, $\alpha 7$ ligands are suitable for the treatment of cognitive disorders including, for example, attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), mild cognitive impairment, senile dementia, AIDS dementia, Pick's disease, dementia
15 associated with Lewy bodies, and dementia associated with Down's syndrome, as well as cognitive deficits associated with schizophrenia.

 In addition, $\alpha 7$ -containing nAChRs have been shown to be involved in the neuroprotective effects of nicotine both in vitro (Jonnala, R. B. and Buccafusco, J. J., *J. Neurosci. Res.* 66: 565-572, 2001) and in vivo (Shimohama, S. et al., *Brain Res.*
20 779: 359-363, 1998). More particularly, neurodegeneration underlies several progressive CNS disorders, including, but not limited to, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, dementia with Lewy bodies, as well as diminished CNS function resulting from traumatic brain injury. For example, the impaired function of $\alpha 7$ nAChRs by β -amyloid peptides
25 linked to Alzheimer's disease has been implicated as a key factor in development of the cognitive deficits associated with the disease (Liu, Q.-S., Kawai, H., Berg, D. K., *PNAS* 98: 4734-4739, 2001). The activation of $\alpha 7$ nAChRs has been shown to block this neurotoxicity (Kihara, T. et al., *J. Biol. Chem.* 276: 13541-13546, 2001). As such, selective ligands that enhance $\alpha 7$ activity can counter the deficits of Alzheimer's
30 and other neurodegenerative diseases.

 Schizophrenia is a complex disease that is characterized by abnormalities in perception, cognition, and emotions. Significant evidence implicates the involvement of $\alpha 7$ nAChRs in this disease, including a measured deficit of these receptors in post-

mortem patients (Leonard, S. Eur. J. Pharmacol. 393: 237-242, 2000). Deficits in sensory processing (gating) are one of the hallmarks of schizophrenia. These deficits can be normalized by nicotinic ligands that operate at the $\alpha 7$ nAChR (Adler L. E. et al., Schizophrenia Bull. 24: 189-202, 1998; Stevens, K. E. et al., Psychopharmacology 5 136: 320-327, 1998). Thus, $\alpha 7$ ligands demonstrate potential in the treatment of schizophrenia.

Angiogenesis, a process involved in the growth of new blood vessels, is important in beneficial systemic functions, such as wound healing, vascularization of skin grafts, and enhancement of circulation, for example, increased circulation around 10 a vascular occlusion. Non-selective nAChR agonists like nicotine have been shown to stimulate angiogenesis (Heeschen, C. et al., Nature Medicine 7: 833-839, 2001). Improved angiogenesis has been shown to involve activation of the $\alpha 7$ nAChR (Heeschen, C. et al., J. Clin. Invest. 110: 527-536, 2002). Therefore, nAChR ligands that are selective for the $\alpha 7$ subtype offer improved potential for stimulating 15 angiogenesis with an improved side effect profile.

A population of $\alpha 7$ nAChRs in the spinal cord modulate serotonergic transmission that have been associated with the pain-relieving effects of nicotinic compounds (Cordero-Erausquin, M. and Changeux, J.-P. PNAS 98:2803-2807, 2001). The $\alpha 7$ nAChR ligands demonstrate therapeutic potential for the treatment of pain 20 states, including acute pain, post-surgical pain, as well as chronic pain states including inflammatory pain and neuropathic pain. Moreover, $\alpha 7$ nAChRs are expressed on the surface of primary macrophages that are involved in the inflammation response, and that activation of the $\alpha 7$ receptor inhibits release of TNF and other cytokines that trigger the inflammation response (Wang, H. et al Nature 421: 384-388, 2003). 25 Therefore, selective $\alpha 7$ ligands demonstrate potential for treating conditions involving TNF-mediated diseases, for example, rheumatoid arthritis, Crohn's disease, ulcerative colitis, inflammatory bowel disease, organ transplant rejection, acute immune disease associated with organ transplantation, chronic immune disease associated with organ transplantation, septic shock, toxic shock syndrome, sepsis syndrome, depression, and 30 rheumatoid spondylitis.

The mammalian sperm acrosome reaction is an exocytosis process important in fertilization of the ovum by sperm. Activation of an $\alpha 7$ nAChR on the sperm cell has been shown to be essential for the acrosome reaction (Son, J.-H. and Meizel, S.

Biol. Reproduct. 68: 1348-1353 2003). Consequently, selective $\alpha 7$ agents demonstrate utility for treating fertility disorders.

Compounds of the invention are particularly useful for treating and preventing a condition or disorder affecting cognition, neurodegeneration, and schizophrenia.

5 Cognitive impairment associated with schizophrenia often limits the ability of patients to function normally, a symptom not adequately treated by commonly available treatments, for example, treatment with an atypical antipsychotic. (Rowley, M. et al., J. Med. Chem. 44: 477-501, 2001). Such cognitive deficit has been linked to dysfunction of the nicotinic cholinergic system, in particular with decreased
10 activity at $\alpha 7$ receptors. (Friedman, J. I. et al., Biol Psychiatry, 51: 349-357, 2002). Thus, activators of $\alpha 7$ receptors can provide useful treatment for enhancing cognitive function in schizophrenic patients who are being treated with atypical antipsychotics. Accordingly, the combination of an $\alpha 7$ nAChR ligand and an atypical antipsychotic would offer improved therapeutic utility. Specific examples of suitable atypical
15 antipsychotics include, but are not limited to, clozapine, risperidone, olanzapine, quetiapine, ziprasidone, zotepine, iloperidone, and the like.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention can be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient,
20 compositions and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and
25 to gradually increase the dosage until the desired effect is achieved.

When used in the above or other treatments, a therapeutically effective amount of one of the compounds of the invention can be employed in pure form or, where such forms exist, in pharmaceutically acceptable salt, ester, amide or prodrug form. Alternatively, the compound can be administered as a pharmaceutical composition
30 containing the compound of interest in combination with one or more pharmaceutically acceptable carriers. The phrase "therapeutically effective amount" of the compound of the invention means a sufficient amount of the compound to treat disorders, at a reasonable benefit/risk ratio applicable to any medical treatment. It

will be understood, however, that the total daily usage of the compounds and compositions of the invention will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder
5 being treated and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like
10 factors well-known in the medical arts. For example, it is well within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The total daily dose of the compounds of this invention administered to a
15 human or lower animal range from about 0.010 mg/kg body weight to about 1 g/kg body weight. More preferable doses can be in the range of from about 0.010 mg/kg body weight to about 100 mg/kg body weight. If desired, the effective daily dose can be divided into multiple doses for purposes of administration. Consequently, single dose compositions may contain such amounts or submultiples thereof to make up the
20 daily dose.

Compounds of the invention are $\alpha 7$ nAChRs ligands that modulate function of $\alpha 7$ nAChRs by altering the activity of the receptor or signaling. The compounds can be inverse agonists that inhibit the basal activity of the receptor or antagonists that completely block the action of receptor-activating agonists. The compounds also can
25 be partial agonists that partially block or partially activate the $\alpha 7$ nAChR receptor or agonists that activate the receptor. Binding to $\alpha 7$ receptor also trigger key signaling processes involving various kinases and phosphatases and protein-protein interactions that are important to effects on memory, cytoprotection, gene transcription and disease modification. Therefore, the administration of a therapeutically effective
30 amount of a compound of formula (I) to a mammal provides a method of selectively modulating the effects of $\alpha 4\beta 2$, $\alpha 7$, or both $\alpha 4\beta 2$ and $\alpha 7$ nicotinic acetylcholine receptors.

Furthermore, the administration of a therapeutically effective amount of a

compound of formula (I) to a mammal provides a method of treating or preventing a condition or disorder selected from the group consisting of attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), mild cognitive impairment, senile dementia, AIDS dementia, Pick's disease, dementia associated with Lewy bodies, dementia associated with Down's syndrome, amyotrophic lateral sclerosis, Huntington's disease, smoking cessation, nicotinic withdrawal syndrome, diminished CNS function associated with traumatic brain injury, acute pain, post-surgical pain, chronic pain, inflammatory pain, neuropathic pain, infertility, need for new blood vessel growth associated with wound healing, need for new blood vessel growth associated with vascularization of skin grafts, and lack of circulation, more particularly circulation around a vascular occlusion, rheumatoid arthritis, Crohn's disease, ulcerative colitis, inflammatory bowel disease, organ transplant rejection, acute immune disease associated with organ transplantation, chronic immune disease associated with organ transplantation, septic shock, toxic shock syndrome, sepsis syndrome, depression, and rheumatoid spondylitis. More preferred, the administration of a therapeutically effective amount of a compound of formula (I) to a mammal provides a method of treating cognitive disorders, neurodegeneration, and schizophrenia. Furthermore, compounds of formula (I) may also be administered in combination with an atypical antipsychotic.

Preparation of Salts

Example A

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane

L-bitartrate anhydrate

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base (21.5 mg, 0.07 mmol) was dissolved in 1.0 mL of 200 proof ethanol. Meanwhile, 11.75 mg of L-tartaric acid (0.08 mmol) was dissolved in 250 μ L 200 proof ethanol. The L-tartaric acid solution was added dropwise to the (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base solution while stirring. The vial was removed from the stir plate after the addition. The L-bitartrate anhydrate crystallized upon standing.

Example B

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane

L-bitartrate hydrate

5

The anhydrate of (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate solid (60 mg) was suspended in water (500 µL) at ambient temperatures. The hydrate of (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate crystallized over time.

10

Example C

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane

dihydrogen phosphate anhydrate

15

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane free base (20 mg, 0.064 mmol) was dissolved in 1.0 mL of methanol. Meanwhile, 5 µL of 85% phosphoric acid (0.073 mmol) was diluted with 245 µL methanol. The phosphoric acid solution was then added dropwise to the (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane free base solution while stirring.

20

The vial was removed from the stir plate after the addition. The dihydrogen phosphate anhydrate crystallized upon standing.

Example D

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane

25

dihydrogen phosphate hydrate

The anhydrous (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate solid was exposed to high humidity. The hydrate of (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate crystallized over time.

30

Example E

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane

bisuccinate anhydrate

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base (20 mg, 0.064 mmol) was dissolved in 1.0 mL of 2-propanol (or tetrahydrofuran). Meanwhile, succinic acid (8.25 mg, 0.07 mmol) was dissolved in 500 μ L of 2-propanol (or tetrahydrofuran). Both solutions were heated to 50°C. The succinic acid solution was then added dropwise to the (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base solution while stirring at 50°C. The vial was removed from the hot/stir plate afterwards. The bisuccinate anhydrate crystallized upon standing and natural cooling to ambient temperatures.

Example F

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
bisuccinate hydrate

15

The anhydrate of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane bisuccinate solid (25 mg) was suspended in 100 μ L of water at ambient temperatures. The hydrate of (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane bisuccinate crystallized over time.

Example G

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
hydrochloride quarterhydrate (1 salt: 0.25 water)

25

(4*s*)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base (40 mg, 0.13 mmol) was dissolved in 2.0 mL of 200 proof ethanol. Concentrated HCl solution (5N, 30 μ L, 0.15 mmol) was diluted with 220 μ L of 200 proof ethanol. The diluted HCl solution was added to the (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base solution while stirring. The vial was removed from the stir plate, and the solvent was allowed to evaporate. The hydrochloride quarterhydrate crystallized over time

30

To prepare a (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride quarterhydrate single crystal, the

supernatant obtained from the above experiment was used for this experiment. Solvent was allowed to evaporate slowly. Single crystals of the hydrochloride quarterhydrate formed over time.

Example H

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
hydrochloride sesquihydrate (1 salt: 1.5 water)

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
10 hydrochloride quarterhydrate solid, 50 mg, was suspended of in 200 µL of water.
(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
hydrochloride sesquihydrate crystallized over time.

Example I

15 (4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
dihydrogen citrate

(4s)-4-(5-Phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free
base (63 mg, 0.2 mmol) was dissolved in 1.0 mL of methanol. Citric acid (41 mg,
20 0.21 mmol) was dissolved in 0.5 mL of methanol. The citric acid solution was added
to the (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
freebase solution while stirring. The vial was removed from the stir plate after the
addition, and the solvent allowed to evaporate slowly. (4s)-4-(5-Phenyl-1,3,4-
thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate crystallized
25 over time.

To prepare a (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-
azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate single crystal, (4s)-4-(5-phenyl-1,3,4-
thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate (20 mg) was
dissolved in 0.8 mL water/2-propanol (1:6, V/V) at 50 °C. The solution was seeded
30 with (4s)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane
dihydrogen citrate solid and allowed to cool to ambient temperatures in a sealed vial.
Single crystals formed over time.

syntheses, formulations and/or methods of use of the invention, may be made without departing from the spirit and scope thereof.

What is claimed is:

1. A compound of formula (I)

5

(I);

or a pharmaceutically acceptable salt or prodrug thereof, wherein

L_1 is -O- or -NR_a-;

A is -Ar₁, -Ar₂-L₂-Ar₃ or -Ar₄-L₃-Ar₅;

Ar₁ is aryl or heteroaryl;

10

Ar₂ is aryl or monocyclic heteroaryl;

Ar₃ is aryl or heteroaryl;

Ar₄ is a bicyclic heteroaryl;

Ar₅ is aryl or heteroaryl;

L₂ is a bond, -O-, -NR_a-, -CH₂-, or -C(O)NR_a-;

15

L₃ is a bond, -O-, -NR_a- or -CH₂-; and

R_a is hydrogen or alkyl.

2. The compound according to claim 1, wherein

A is Ar₁.

20

3. The compound according to claim 2, wherein Ar₁ is selected from

wherein D_1 , E_1 , F_1 , J_1 , K_1 , X_8 , X_9 , X_{10} , and X_{11} are each independently $-CR_1$ or N;

X_{12} , X_{13} , X_{14} , X_{15} , M_1 , and M_2 are each independently $-CR_1$, N or C;

5 G_1 is O, $-NR_{1a}$, or S;

Y_1 is $-CR_1$ or N;

Y_2 is $-CR_1$ or N;

Y_3 is NH, O, or S

R_1 is hydrogen, alkyl, alkoxy, alkoxycarbonyl, cyano, halo, nitro, $-NR_bR_c$,

10 haloalkyl, or $-C(O)NR_bR_c$;

R_{1a} is hydrogen or alkyl;

R_b and R_c are each independently hydrogen, alkyl, alkoxycarbonyl, or alkylcarbonyl;

one of X_{12} - X_{15} is C; and

15 M_1 or M_2 is C.

4. The compound according to claim 3, wherein

L_1 is $-O-$.

20 5. The compound according to claim 3, wherein

L_1 is $-NR_a-$.

6. The compound according to claim 1, wherein

A is $-\text{Ar}_2-\text{L}_2-\text{Ar}_3$.

7. The compound according to claim 6, wherein

5 Ar_2 is a group selected from

D_2 , E_2 , F_2 , J_2 , and K_2 are each independently $-\text{CT}_2$ or N ;

G_2 is O , $-\text{NR}_{2a}$, or S ;

in each group of (i), (ii), and (iii), one substituent represented by T_2 , or R_{2a}

10 wherein R_{2a} is T_2 , is $-\text{L}_2-\text{Ar}_3$ and the other substituents represented by T_2 are

hydrogen, alkyl, alkoxy, alkoxycarbonyl, cyano, halo, nitro, or $-\text{NR}_b\text{R}_c$;

R_{2a} is hydrogen, alkyl, or T_2 ; and

R_b and R_c are each independently hydrogen, alkyl, alkoxycarbonyl or alkylcarbonyl.

15

8. The compound according to claim 6, wherein

Ar_3 is a group selected from

wherein D_3 , E_3 , F_3 , J_3 , K_3 , X_8 , X_9 , X_{10} , and X_{11} are each independently $-CR_3$ or N;

X_{16} , X_{17} , X_{18} , X_{19} , M_1 , and M_2 are each independently $-CR_3$, N, or C;

5 G_3 is O, $-NR_{3a}$, or S;

Y_1 is $-CR_3$ or N;

Y_2 is $-CR_3$ or N;

Y_3 is NH, O, or S;

10 R_3 is hydrogen, alkyl, alkoxy, alkoxyalkyl, alkoxycarbonyl, alkylcarbonyl, cyano, halo, haloalkoxy, haloalkyl, hydroxy, nitro, R_eR_fN- , or aryl, wherein aryl is preferably phenyl optionally substituted with halo, alkyl or cyano;

R_{3a} is hydrogen, alkyl, alkylcarbonyl, tritylaryl, wherein aryl is preferably phenyl;

15 R_e and R_f are each independently hydrogen, alkyl, alkoxycarbonyl, or alkylcarbonyl, or R_e and R_f are each taken together with the nitrogen atom to which they are attached form a heterocyclic ring, wherein the heterocyclic ring is preferably pyrrolidinyl, piperidinyl or piperazinyl;

one of X_{16} , X_{17} , X_{18} , and X_{19} , is C; and

M_1 or M_2 is C;

9. The compound according to claim 6, wherein
 L_1 is $-NR_{4a}-$; and
 L_2 is a bond.

5

10. The compound according to claim 6, wherein
 L_1 is $-O-$; and
 L_2 is a bond.

- 10 11. The compound according to claim 1, wherein
 A is $-Ar_4-L_3-Ar_5$.

12. The compound according to claim 1, wherein
 $-Ar_4-L_3-Ar_5$ is

15

Y_4 is $-NR_{4a}$, O or S;

Y_5 is N, C or $-CR_4$;

Y_6 is N, C or $-CR_4$;

provided that one of Y_5 and Y_6 is C;

- 20 R_4 is hydrogen, alkyl, alkoxy, alkoxylalkyl, alkoxycarbonyl, alkylcarbonyl,
 cyano, halo, haloalkoxy, haloalkyl, hydroxy, nitro, oxo, or R_eR_fN- ;

R_{4a} is hydrogen or alkyl;

- R_e and R_f are each independently hydrogen, alkyl, alkoxycarbonyl or
 alkylcarbonyl, or R_e and R_f are each taken together with the nitrogen atom to which
 25 they are attached form a heterocyclic ring, wherein the heterocyclic ring is preferably
 pyrrolidiny, piperidiny or piperazinyl;

X_4 is N, C, or $-CR_{X4}$;

X_5 is N, C, or $-CR_{X5}$;

X_6 is N, C, or $-CR_{X6}$;

- 30 X_7 is N, C, or $-CR_{X7}$;

provided that only one of X_4 , X_5 , X_6 , or X_7 may be N, only one is C, and the

remaining must be other than N; and

R_{X4}, R_{X5}, R_{X6}, and R_{X7} are each independently hydrogen or alkyl.

13. A compound of claim 1, wherein the compound is

- 5 (4*s*)-4-(6-chloropyridazin-3-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane;
 (4*r*)-4-(6-chloropyridazin-3-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane;

14. A method for treating or preventing conditions, disorders, or deficits modulated by $\alpha 7$ nicotinic acetylcholine receptors, $\alpha 4\beta 2$ nicotinic acetylcholine receptors, or both $\alpha 7$ and $\alpha 4\beta 2$ nicotinic acetylcholine receptors wherein the
 15 condition, disorder, or deficit is selected from the group consisting of a memory disorder, cognitive disorder, neurodegeneration, and neurodevelopmental disorder comprising administration of a therapeutically suitable amount of a compound of formula (I).

20 15. The method according to claim 14, wherein the condition or disorder is selected from the group consisting of attention deficit disorder, attention deficit hyperactivity disorder (ADHD), Alzheimer's disease (AD), mild cognitive impairment, schizophrenia, age-associated memory impairment (AAMI), senile dementia, AIDS dementia, Pick's disease, dementia associated with Lewy bodies,
 25 dementia associated with Down's syndrome, amyotrophic lateral sclerosis, Huntington's disease, smoking cessation, nicotinic withdrawal syndrome, schizoaffective disorder, bipolar and manic disorders, diminished CNS function associated with traumatic brain injury, acute pain, post-surgical pain, chronic pain, inflammatory pain, and neuropathic pain.

30 16. The method according to claim 14, wherein the condition or disorder is cognitive deficits associated with attention deficit hyperactivity disorder, schizophrenia, Alzheimer's disease, mild cognitive impairment, age-associated

memory impairment, and cognitive deficits of schizophrenia.

17. The method according to claim 14, further comprising administering a compound of formula (I) in combination with an atypical antipsychotic.

5

18. The method according to claim 14, wherein the condition or disorder is selected from the group consisting of infertility, lack of circulation, need for new blood vessel growth associated with wound healing, need for new blood vessel growth associated with vascularization of skin grafts, ischemia, inflammation, arthritis and related disorders, wound healing, and complications associated with diabetes.

10

19. A method of using the compound of formula (V)

(V),

15

to prepare compounds of formula (I) of claim 1.

20. A compound of formula (VI)

(VI) ;

or a pharmaceutically acceptable salt or prodrug thereof, wherein

20

L_1 is -O- or $-NR_a$;

A is $-Ar_1$, $-Ar_2-L_2-Ar_3$ or $-Ar_4-L_3-Ar_5$;

Ar_1 is aryl or heteroaryl;

Ar_2 is aryl or monocyclic heteroaryl;

Ar_3 is aryl or heteroaryl;

25

Ar_4 is bicyclic heteroaryl;

Ar_5 is aryl or heteroaryl;

L_2 is a bond, -O-, $-NR_a$ -, $-CH_2$ -, or $-C(O)NR_a$;

L_3 is a bond, -O-, $-NR_a$ - or $-CH_2$ -; and

R_a is hydrogen or alkyl.

21. The compound of claim 20, wherein the compound is a prodrug of a compound of formula (I) of claim 1.

5

22. The compound of claim 20, wherein the compound is

23. A compound of formula (VII)

or a pharmaceutically acceptable salt or prodrug thereof, wherein

15 L₁ is -O- or -NR_a-;

A is -Ar₁, -Ar₂-L₂-Ar₃ or -Ar₄-L₃-Ar₅;

Ar₁ is aryl or heteroaryl;

Ar₂ is aryl or monocyclic heteroaryl;

Ar₃ is aryl or heteroaryl;

20 Ar₄ is bicyclic heteroaryl;

Ar₅ is aryl or heteroaryl;

L₂ is a bond, -O-, -NR_a-, -CH₂-, or -C(O)NR_a-;

L₃ is a bond, -O-, -NR_a- or -CH₂-; and

R_a is hydrogen or alkyl.

25

24. The compound of claim 23, wherein the compound is a prodrug of a compound of formula (I) of claim 1.

25. The compound of claim 23, wherein the compound is

30 (4*s*)-4-[5-(1*H*-indol-5-yl)-thiazol-2-yloxy]-1-azatricyclo[3.3.1.^{3,7}]decane-1-

oxide;

(4*s*)-5-4-[2-(1-azatricyclo[3.3.1.1^{3,7}]decan-1-oxide-yloxy)thiazol-5-yl]-

indolin-2-one; or

(4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane-1-

5 oxide.

26. A compound that is (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-

azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate anhydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-

2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate hydrate, (4*s*)-4-(5-phenyl-1,3,4-

10 thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate anhydrate,

(4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen

phosphate hydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-

azatricyclo[3.3.1.1^{3,7}]decane bisuccinate anhydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-

2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane bisuccinate hydrate, (4*s*)-4-(5-phenyl-1,3,4-

15 thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane hydrochloride quarterhydrate,

(4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane

hydrochloride sesquihydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-

azatricyclo[3.3.1.1^{3,7}]decane dihydrogen citrate, or (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-

2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane monohydrogen citrate.

20

27. A crystalline salt (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-

azatricyclo[3.3.1.1^{3,7}]decane identified by powder X-ray diffraction wherein the salt

is:

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-

25 azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate anhydrate demonstrating at least one

characteristic peak in the powder X-ray diffraction pattern at values of two theta of

4.96±0.20, 9.99±0.20, 11.77±0.20, 14.62±0.20, 14.99±0.20, 18.14±0.20, 18.44±0.20,

19.48±0.20, 20.05±0.20, 21.02±0.20, 21.38±0.20, 22.76±0.20, 24.74±0.20,

26.65±0.20, and 32.19±0.20;

30 crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-

azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate hydrate demonstrating at least one

characteristic peak in the powder X-ray diffraction pattern at values of two theta of

4.63±0.20, 9.26±0.20, 13.43±0.20, 13.91±0.20, 15.98±0.20, 17.86±0.20, 21.36±0.20,

and 22.33±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate anhydrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 5.14±0.20, 10.31±0.20, 11.20±0.20, 13.17±0.20, 13.47±0.20, 15.61±0.20, 16.69±0.20, 17.27±0.20, 17.50±0.20, 18.56±0.20, 18.90±0.20, 19.41±0.20, 20.93±0.20, 21.80±0.20, 22.53±0.20, 23.96±0.20, 26.01±0.20, and 26.44±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate hydrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 5.28±0.20, 9.82±0.20, 10.61±0.20, 13.79±0.20, 14.24±0.20, 15.13±0.20, 16.65±0.20, 16.95±0.20, 18.35±0.20, 19.52±0.20, 19.84±0.20, 21.55±0.20, 23.85±0.20, 24.26±0.20, and 25.80±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane bisuccinate anhydrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 12.53±0.20, 13.50±0.20, 14.76±0.20, 16.98±0.20, 18.07±0.20, 18.34±0.20, 18.35±0.20, 18.88±0.20, 19.62±0.20, 19.67±0.20, 20.00±0.20, 20.71±0.20, 23.64±0.20, 23.96±0.20, 25.61±0.20, and 36.29±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane bisuccinate hydrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 8.92±0.20, 10.94±0.20, 11.71±0.20, 13.41±0.20, 14.90±0.20, 17.61±0.20, 17.92±0.20, 18.19±0.20, 19.60±0.20, 22.58±0.20, 26.19±0.20, and 27.07±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane hydrochloride quarterhydrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 5.19±0.20, 12.96±0.20, 13.00±0.20, 14.88±0.20, 14.98±0.20, 15.61±0.20, 17.79±0.20, 18.26±0.20, 18.93±0.20, 20.02±0.20, 20.67±0.20, 20.86±0.20, 21.72±0.20, 22.38±0.20, 22.55±0.20, 24.09±0.20, and 26.10±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane hydrochloride sesquihydrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 4.94±0.20, 9.93±0.20, 14.09±0.20, 14.90±0.20, 17.85±0.20, 19.92±0.20, 21.72±0.20, 22.43±0.20, 22.63±0.20, and 23.95±0.20;

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen citrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 7.98±0.20, 11.98±0.20, 12.45±0.20, 15.76±0.20, 16.00±0.20, 17.75±0.20, 18.79±0.20, 18.82±0.20, 20.59±0.20, 22.25±0.20, 22.61±0.20, 24.16±0.20, 24.79±0.20, 25.06±0.20, 26.21±0.20, and 29.43±0.20; or

crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane monohydrogen citrate demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 9.37±0.20, 9.62±0.20, 10.30±0.20, 11.24±0.20, 12.18±0.20, 13.73±0.20, 15.55±0.20, 16.17±0.20, 16.37±0.20, 16.76±0.20, 18.35±0.20, 18.67±0.20, 18.89±0.20, 19.98±0.20, 20.48±0.20, 20.94±0.20, 21.54±0.20, and 22.02±0.20.

28. Crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane free base demonstrating at least one characteristic peak in the powder X-ray diffraction pattern at values of two theta of 7.18±0.20, 10.19±0.20, 13.90±0.20, 14.37±0.20, 14.40±0.20, 14.66±0.20, 15.09±0.20, 15.21±0.20, 18.13±0.20, 18.43±0.20, 19.41±0.20, 19.88±0.20 (two peaks), 20.09±0.20, 20.46±0.20, 21.66±0.20, 23.08±0.20, 26.84±0.20, 28.71±0.20, and 30.90±0.20.

29. Substantially pure crystalline (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate anhydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane L-bitartrate hydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate anhydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen phosphate hydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane bisuccinate anhydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane bisuccinate hydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane hydrochloride quarterhydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane hydrochloride sesquihydrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane dihydrogen citrate, (4*s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.1^{3,7}]decane monohydrogen citrate, or (4*s*)-4-(5-phenyl-

1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane.

30. Crystalline (*4s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane bisuccinate anhydrate having unit cell parameters
5 wherein a is 12.958(17) Å, b is 7.561(10) Å, c is 39.66(5) Å, and β is 94.54(2)°.

31. Crystalline (*4s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane hydrochloride quarterhydrate having the unit cell parameters wherein a is 19.440(7) Å, b is 9.969(4) Å, c is 35.322(13) Å, and β is
10 105.325(17)°.

32. Crystalline (*4s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane dihydrogen citrate having the unit cell parameters wherein a is 22.651(8) Å, b is 9.992(3) Å, c is 10.338(4) Å, and β is 101.961(5)°.
15

33. Crystalline (*4s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane free base having the unit cell parameters wherein a is 6.4427(17) Å, b is 9.895(3) Å, c is 13.102(4) Å, and α is 70.145(4)°, β is 81.691(4)°, and γ is 73.391(4)°.
20

34. A process for preparing a citric acid salt of (*4s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane comprising recrystallizing (*4s*)-4-(5-phenyl-1,3,4-thiadiazol-2-yloxy)-1-azatricyclo[3.3.1.^{3,7}]decane in citric acid and methanol.
