

ABSTRACT

The electronic device is an electronic device (100) having a multilayer structure including a touch panel (12) and a display device (10), the electronic device including a manipulation surface (22A) configured to accept an input from a user, the manipulation surface being provided on a surface closer to the touch panel, and constituting a curved surface such that a central portion of the manipulation surface (22A) is dented relative to an end of the manipulation surface (22A). The most-dented portion of the manipulation surface (22A) is dented relative to an end of the manipulation surface (22A) by a distance of not less than 0.2 mm and not more than 3.0 mm along a direction perpendicular to the panel plane.
