

METHOD AND DEVICE FOR PROVIDING INFORMATION RELATED TO GRADE FOR MIXED IRON SCRAP

ABSTRACT

A method for providing information related to a grade for mixed iron scrap includes obtaining policy information on a grade for mixed iron scrap for a first type of iron scrap and a second type of iron scrap; determining a normal purchase unit price for each type based on the policy information; determining a weighted average unit price for the mixed iron scrap based on a percentage of the first type of iron scrap, a percentage of the second type of iron scrap, and the normal purchase unit prices; and determining the grade for the mixed iron scrap to be a first grade corresponding to the first type of iron scrap or a second grade corresponding to the second type of iron scrap based on a result of comparing a threshold weighted average unit price determined based on the policy information with the weighted average unit price.
