### Abstract

In a television receiver including a feature allowing a user to select a color temperature at which whites will be produced on a display screen, circuitry (SW1R;SW1B) is provided for altering the gain of the red and blue kine driver stages (R210;B210) and simultaneously automatically altering (SW2R;SW2B) the gain of the R-Y and B-Y color difference signal amplifier (R220;B220), to correct for errors which would otherwise be introduced by adversely altering the B-Y / R-Y ratio.
