

ABSTRACT OF THE DISCLOSURES

A PREDICTIVE METHOD FOR MULTI-PARTY STRENGTHENING OF AUTHENTICATION CREDENTIALS WITH NON-REAL TIME SYNCHRONIZATION

A method and system for strengthening authentication credentials for accessing any number of applications across multiple access interfaces and across multiple remote access sites is disclosed. The applications can be accessed by a set of authorized users by using multiple instances of a predictive scheme for generating and synchronizing the authentication credentials and by leveraging pre-existing infrastructure associated with the applications.
