ABSTRACT OF THE DISCLOSURE

The base station 6 incorporates the line supervisor 8, the line switch 9, and the signal returner 10. If there is originated a call request signal for the mobile station 3 by the mobile station 2 after occurrence of a break
5 in the line between the base station 6 and the control station 21, the line supervisor 8 notifies the line switch 9 of the line switch signal. In response to the line switch signal, the line switch 9 actuates the signal returner 10. Thereafter, the signal returner 10 returns the call request signal over the base station zone of the base station 6. This enables
10 communication among the mobile stations 2 and 3 laid in the base station zone of the base station 6.
