

Process for preparing water-redispersible polymer powders

5 The invention relates inter alia to processes for preparing polymerizates of ethyleni-
cally unsaturated monomers in the form of water-redispersible powders (polymer
powders) by mixing aqueous dispersions of polymerizates of ethylenically unsatu-
rated monomers with one or more desiccant aids and subsequently drying the mix-
ture, characterized in that the desiccant aids comprise ≥ 60 wt.%, relative to the en-
tire weight of the desiccant aids, of one or more salts of organic compounds (organic
10 salts) that contain 1 to 10 carbon atoms.
