ABSTRACT

To provide a green-sheet stacking apparatus for continuously and smoothly cutting a green ceramic sheet carried by a carrier film, detaching it from the carrier film, and stacking it so that delamination is unlikely to occur in a laminate and a sintered compact obtained after sintering.

A green-sheet stacking apparatus comprises a cutter 8 comprising a blade 11, for cutting a green ceramic sheet 3 carried by a carrier film 2 into a flat, predetermined shape, and a stacker 9, which is disposed independent of the cutter 8, for press-attaching and stacking a cut-out green ceramic sheet 3a having the flat, predetermined shape on a stacking surface 9a.
