ABSTARCT OF THE DISCLOSURE

METHOD OF MANAGING FACILITIES INFORMATION

The structure of managing facilities information is configured to: allow definition of attribute items labeled as one unity for facilities to be managed; classify the attribute items into several portions which are labeled and grouped as attribute definition groups; hierarchically arrange the facilities to be managed to allow selection of applicable attribute items from the attribute definition groups for each facility; allow definition of labels which can be made to correspond to the attribute definition groups independently from the definition; allow change of the labels made to correspond to the attribute definition groups to the facilities attribute groups; and allocate non-duplicate internal numbers to the facilities arranged hierarchically as nodes to provide a table of the attribute items with the internal number as a main key.
