

ABSTRACT

Provided is a pressure-sensitive adhesive layer that has sebum-induced swelling and satisfactorily level difference absorbency. This pressure-sensitive adhesive layer is formed from a pressure-sensitive adhesive including an acrylic polymer and has a 300-percent tensile residual stress of 0.1 to 6 N/cm². The acrylic polymer is derived from monomer components including, relative to the totality of the monomer components, 40 to 82 mass percent of a (meth)acrylic alkyl ester having a C₁-C₅ alkyl moiety at the ester end; 17 to 35 mass percent of a hydroxy-containing monomer; and 42 mass percent or less of a specific alicyclic structure-containing monomer.
