

BATTERY UNIT

ABSTRACT

A battery unit includes a power storage unit for
5 supplying power to an external device, a communication unit
for performing communication with the external device, and a
processor for performing a control process on the external
device on the basis of a power storage status of the power
storage unit or information obtained from the external device.
10 For example, when the state of charge (SOC) of the power
storage unit has lowered, the processor limits the operation
of a household electric appliance with a low priority level
in the control process.
