

TRICYCLIC HETEROCYCLIC COMPOUNDS AS PHOSPHOINOSITIDE 3-  
KINASE INHIBITORS

**Field of the Invention**

5           The present invention relates to novel compounds which act as inhibitors of the class IA phosphoinositide 3-kinase enzyme, PI3K-p110 $\delta$ , for the treatment of cancer, immune and inflammatory diseases.

**Background of the Invention**

10           The phosphoinositide 3-kinases (PI3Ks) constitute a family of lipid kinases involved in the regulation of a network of signal transduction pathways that control a range of cellular processes. PI3Ks are classified into three distinct subfamilies, named class I, II, and III based upon their substrate specificities. Class IA PI3Ks possess a p110 $\alpha$ , p110 $\beta$ , or p110 $\delta$  catalytic subunit complexed  
15 with one of three regulatory subunits, p85 $\alpha$ , p85 $\beta$  or p55 $\delta$ . Class IA PI3Ks are activated by receptor tyrosine kinases, antigen receptors, G-protein coupled receptors (GPCRs), and cytokine receptors. The class IA PI3Ks primarily generate phosphatidylinositol-3,4,5-triphosphate (PI(3,4,5)P<sub>3</sub>), a second messenger that activates the downstream target AKT. The consequences of  
20 biological activation of AKT include tumour cell progression, proliferation, survival and growth, and there is significant evidence suggesting that the PI3K/AKT pathway is dysregulated in many human cancers. Additionally, PI3K activity has been implicated in endocrinology, cardiovascular disease, immune disorders and inflammation. It has been established that PI3K-p110 $\delta$  plays a  
25 critical role in the recruitment and activation of immune and inflammatory cells. PI3K-p110 $\delta$  is also upregulated in a number of human tumours and plays a key role in tumour cell proliferation and survival.

Compounds which are able to modulate p110 $\delta$  activity have important therapeutic potential in cancer and immune and inflammatory disorders.

30           WO 2011/021038 describes compounds which act as inhibitors of PI3K-p110 $\delta$ .

**Summary of the Invention**

The present invention relates to a selection of compounds having increased activity and/or bioavailability over the compounds described in WO 2011/021038. Examples of structures embodying the invention are:

Pharmaceutically acceptable bases include alkali metal (e.g. sodium or potassium) and alkali earth metal (e.g. calcium or magnesium) hydroxides and organic bases such as alkyl amines, aryl amines or heterocyclic amines.

For the avoidance of doubt, the present invention also embraces prodrugs which react *in vivo* to give a compound of the present invention.

The compounds of the invention may be prepared by synthetic routes that will be apparent to those skilled in the art, e.g. based on the Examples.

The compounds of the invention and compositions comprising them may be administered in a variety of dosage forms. In one embodiment, a pharmaceutical composition comprising a compound of the invention may be formulated in a format suitable for oral, rectal, parenteral, intranasal or

transdermal administration or administration by inhalation or by suppository. Typical routes of administration are parenteral, intranasal or transdermal administration or administration by inhalation.

The compounds of the invention can be administered orally, for example  
5 as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules. Preferred pharmaceutical compositions of the invention are compositions suitable for oral administration, for example tablets and capsules. In some embodiments, disclosed compounds may have significantly higher oral bioavailability as compared to compounds having a non-spirocycle or non-  
10 bridged heterocyclic moiety, e.g., at R<sup>2</sup> above. .

The compounds of the invention may also be administered parenterally, whether subcutaneously, intravenously, intramuscularly, intrasternally, transdermally or by infusion techniques. The compounds may also be administered as suppositories.

15 The compounds of the invention may also be administered by inhalation. An advantage of inhaled medications is their direct delivery to the area of rich blood supply in comparison to many medications taken by oral route. Thus, the absorption is very rapid as the alveoli have an enormous surface area and rich blood supply and first pass metabolism is bypassed. A further advantage may be  
20 to treat diseases of the pulmonary system, such that delivering drugs by inhalation delivers them to the proximity of the cells which are required to be treated.

The present invention also provides an inhalation device containing such a pharmaceutical composition. Typically said device is a metered dose inhaler  
25 (MDI), which contains a pharmaceutically acceptable chemical propellant to push the medication out of the inhaler.

The compounds of the invention may also be administered by intranasal administration. The nasal cavity's highly permeable tissue is very receptive to medication and absorbs it quickly and efficiently, more so than drugs in tablet  
30 form. Nasal drug delivery is less painful and invasive than injections, generating less anxiety among patients. By this method absorption is very rapid and first pass metabolism is usually bypassed, thus reducing inter-patient variability.

Further, the present invention also provides an intranasal device containing such a pharmaceutical composition.

The compounds of the invention may also be administered by transdermal administration. The present invention therefore also provides a  
5 transdermal patch containing a compound of the invention.

The compounds of the invention may also be administered by sublingual administration. The present invention therefore also provides a sub-lingual tablet comprising a compound of the invention.

A compound of the invention may also be formulated with an agent which  
10 reduces degradation of the substance by processes other than the normal metabolism of the patient, such as anti-bacterial agents, or inhibitors of protease enzymes which might be the present in the patient or in commensural or parasite organisms living on or within the patient, and which are capable of degrading the compound.

15 Liquid dispersions for oral administration may be syrups, emulsions and suspensions.

Suspensions and emulsions may contain as carrier, for example a natural gum, agar, sodium alginate, pectin, methylcellulose, carboxymethylcellulose, or polyvinyl alcohol. The suspension or solutions for intramuscular injections may  
20 contain, together with the active compound, a pharmaceutically acceptable carrier, e.g. sterile water, olive oil, ethyl oleate, glycols, e.g. propylene glycol, and if desired, a suitable amount of lidocaine hydrochloride.

Solutions for injection or infusion may contain as carrier, for example, sterile water or preferably they may be in the form of sterile, aqueous, isotonic  
25 saline solutions.

30 such as platinum complexes, anti-metabolites, DNA topoisomerase inhibitors, radiation, antibody-based therapies (for example herceptin and rituximab), anti-cancer vaccination, gene therapy, cellular therapies, hormone therapies or cytokine therapy.

In one embodiment of the invention a compound of the invention is used in combination with another chemotherapeutic or antineoplastic agent in the treatment of a cancer. Examples of such other chemotherapeutic or antineoplastic agents include platinum complexes including cisplatin and carboplatin, mitoxantrone, vinca alkaloids for example vincristine and vinblastine, anthracycline antibiotics for example daunorubicin and doxorubicin, alkylating agents for example chlorambucil and melphalan, taxanes for example paclitaxel, antifolates for example methotrexate and tomudex, epipodophyllotoxins for example etoposide, camptothecins for example irinotecan and its active metabolite SN38 and DNA methylation inhibitors for example the DNA methylation inhibitors disclosed in WO02/085400.

According to the invention, therefore, products are provided which contain a compound of the invention and another chemotherapeutic or antineoplastic agent as a combined preparation for simultaneous, separate or sequential use in alleviating a cancer. Also provided according to the invention is the use of compound of the invention in the manufacture of a medicament for use in the alleviation of cancer by coadministration with another chemotherapeutic or antineoplastic agent. The compound of the invention and the said other agent may be administered in any order. In both these cases the compound of the invention and the other agent may be administered together or, if separately, in any order as determined by a physician.

The PI3K inhibitors of the present invention may also be used to treat abnormal cell proliferation due to insults to body tissue during surgery in a human patient. Repetitive motion disorders that may be treated using the present invention include carpal tunnel syndrome. An example of a cell proliferative disorder that may be treated using the invention is a bone tumour.

Proliferative responses associated with organ transplantation that may be treated using PI3K inhibitors of the invention include proliferative responses contributing to potential organ rejections or associated complications.

Specifically, these proliferative responses may occur during transplantation of the heart, lung, liver, kidney, and other body organs or organ systems.

- 5 Chronic inflammation depends on continuous formation of capillary sprouts to maintain an influx of inflammatory cells. The influx and presence of the inflammatory cells produce granulomas and thus maintains the chronic inflammatory state. Inhibition of angiogenesis using a PI3K inhibitor alone or in conjunction with other anti-inflammatory agents may prevent the formation of the
- 10 granulomas and thus alleviate the disease. Examples of chronic inflammatory diseases include, but are not limited to, inflammatory bowel diseases such as Crohn's disease and ulcerative colitis, psoriasis, sarcoidosis, and rheumatoid arthritis.

- Inflammatory bowel diseases such as Crohn's disease and ulcerative
- 15 colitis are characterised by chronic inflammation and angiogenesis at various sites in the gastrointestinal tract. For example, Crohn's disease occurs as a chronic transmural inflammatory disease that most commonly affects the distal ileum and colon but may also occur in any part of the gastrointestinal tract from the mouth to the anus and perianal area. Patients with Crohn's disease generally
- 20 have chronic diarrhoea associated with abdominal pain, fever, anorexia, weight loss and abdominal swelling. Ulcerative colitis is also a chronic, nonspecific, inflammatory and ulcerative disease arising in the colonic mucosa and is characterised by the presence of bloody diarrhoea. These inflammatory bowel diseases are generally caused by chronic granulomatous inflammation
- 25 throughout the gastrointestinal tract, involving new capillary sprouts surrounded by a cylinder of inflammatory cells. Inhibition of angiogenesis by these inhibitors should inhibit the formation of the sprouts and prevent the formation of granulomas. Inflammatory bowel diseases also exhibit extra intestinal manifestations, such as skin lesions. Such lesions are characterized by
- 30 inflammation and angiogenesis and can occur at many sites other the gastrointestinal tract. Inhibition of angiogenesis by PI3K inhibitors according to the present invention can reduce the influx of inflammatory cells and prevent lesion formation.

Sarcoidosis, another chronic inflammatory disease, is characterized as a multisystem granulomatous disorder. The granulomas of this disease can form anywhere in the body. Thus, the symptoms depend on the site of the granulomas and whether the disease is active. The granulomas are created by  
5 the angiogenic capillary sprouts providing a constant supply of inflammatory cells. By using PI3K inhibitors according to the present invention to inhibit angiogenesis, such granulomas formation can be inhibited. Psoriasis, also a chronic and recurrent inflammatory disease, is characterised by papules and plaques of various sizes. Treatment using these inhibitors alone or in conjunction  
10 with other anti-inflammatory agents should prevent the formation of new blood vessels necessary to maintain the characteristic lesions and provide the patient relief from the symptoms.

Rheumatoid arthritis (RA) is also a chronic inflammatory disease characterised by non-specific inflammation of the peripheral joints. It is believed  
15 that the blood vessels in the synovial lining of the joints undergo angiogenesis. In addition to forming new vascular networks, the endothelial cells release factors and reactive oxygen species that lead to pannus growth and cartilage destruction. The factors involved in angiogenesis may actively contribute to, and help maintain, the chronically inflamed state of rheumatoid arthritis. Treatment  
20 using PI3K inhibitors according to the present invention alone or in conjunction with other anti-RA agents may prevent the formation of new blood vessels necessary to maintain the chronic inflammation.

Preferably, the condition is cancer, notably leukaemias including chronic myelogenous leukaemia and acute myeloid leukaemia, lymphomas, solid  
25 tumours, and PTEN-negative tumours including PTEN-negative haematological, breast, lung, endometrial, skin, brain and prostate cancers (where PTEN refers to "phosphatase and tensin homolog deleted on chromosome 10"). More preferably, the condition to be treated in a patient in need thereof by administering an effective amount of a disclosed compound is a disorder selected from  
30 rheumatoid arthritis, asthma, chronic obstructive pulmonary disease (COPD), multiple sclerosis, psoriasis and other inflammatory skin disorders, systemic lupus erythematosus, inflammatory bowel disease, and organ transplant rejection. For example, provided herein is a method of treating a patient suffering

- a disorder selected from the group consisting leukaemias ( including e.g., chronic myelogenous leukaemia and acute myeloid leukaemia), lymphoma, a solid tumour cancer such as breast, lung, or prostate cancer, PTEN-negative tumours including PTEN-negative haematological, breast, lung, endometrial, skin, brain and prostate cancers (where PTEN refers to "phosphatase and tensin homolog deleted on chromosome 10") comprising administering an effective amount of a disclosed compound.

The invention will now be illustrated by the following Examples.

Example B

Oral bioavailability (F) = 74%

Clearance = 33mL/min/kg

**Example G**

The following protocol was used to determine oral bioavailability and clearance, and the results are shown below:

- 5     • Species = male mouse;
- Strain = Balb/c;
- 18 male mice were divided into two groups Group 1 (3 mg/kg; I.V.), Group 2 (10 mg/kg; P.O.) with each group comprising of nine mice;
- 10    • Blood samples (approximately 60  $\mu$ L) were collected from retro orbital plexus under light isoflurane anesthesia such that the samples were obtained at pre-dose, 0.08, 0.25, 0.5, 1, 2, 4, 8 and 24 hr (I.V.) and pre-dose, 0.25, 0.5, 1, 2, 4, 6, 8 and 24 hr (P.O.);
- The blood samples were collected from set of three mice at each time point in labeled micro centrifuge tube containing K2EDTA as anticoagulant;
- 15    • Plasma samples were separated by centrifugation of whole blood and stored below -70°C until bioanalysis;
- All samples were processed for analysis by protein precipitation using acetonitrile (ACN) and analyzed with fit for purpose LC/MS/MS method (LLOQ: 2.47 ng/mL);
- 20    • Pharmacokinetic parameters were calculated using the non-compartmental analysis tool of Phoenix WinNonlin (Version 6.3).

**Formulation:**

Animals in Group 1 were administered intravenously with Example G solution formulation in 5% NMP, 5% solutol HS-15 in 90% HP $\beta$ CD solution (20% HP $\beta$ CD in RO water) at 3 mg/kg dose.

Animals in Group 2 were administered orally with 10 mg/kg solution formulation of Example G in 5% NMP, 5% solutol HS-15 in 90% HP $\beta$ CD solution (20% HP $\beta$ CD in RO water)

Dosing: 10mg/kg P.O. and 3mg/kg I.V.
