

ABSTRACT

In an offshore floating structure, a plurality of tank modules 200 are provided between a bow module 100 and a stern module 300. A production facility can be mounted on upper decks of each of the tank modules 200. The breadths and the depths are common to the bow module 100, the stern module 300, and the plurality of tank modules 200. The bow module 100, the stern module 300, and the plurality of tank modules 200 are separately designed and connected to each other to form the offshore floating structure.
