

CONTENT GENERATION SYSTEM, METHOD, PROGRAM, AND STORAGE
MEDIUM

ABSTRACT

The content generation system is a content generation system for generating content constituted by one or more frames including a moving image or a still image of a character, and includes: a display control unit configured to allow a display unit to display a user interface including a first two-dimensional operation region and a preview image of a frame to be edited by a user; an expression determination unit configured to determine an expression of a character on the preview image depending on a position of a pointer on the first two-dimensional operation region; and a content generation unit configured to generate content constituted by one or more frames including the frame edited by the user.
