(54) Title: ICE-MAKER TREATMENT SYSTEM

(57) Abstract

A system for disinfecting water in an ice-making machine (10) having a water inlet (24) for receiving an incoming stream of water, a supply of recirculating water, a reservoir (14) for containing the supply of recirculating water, a transport conduit (18) for transporting water from the reservoir (14), and an evaporator plate (12) which receives water from the transport conduit (18) and over which at least one of the incoming stream and the recirculating supply can flow to form ice. The system (10) comprises means for treating at least one of the incoming stream and the recirculating supply in the transport conduit (18) before the water from either flows over the evaporator plate (12).
