

ABSTRACT

It is an object of the present invention to provide a release film for forming of a ceramic green sheet, which has excellent light peelability and is less likely to cause damage such as cracks in a half cut test for a super-thin ceramic green sheet to be formed. A release film for production of a ceramic green sheet, includes: a polyester film; and a release layer laminated on at least one surface of the polyester film directly or with another layer interposed therebetween. The release layer is formed by curing a coating film containing at least an energy ray-curable compound (I), a polyester resin or a polyester urethane resin (II), and a release component (III). The energy ray-curable compound (I) has a hydroxyl value of 45 mgKOH/g or less.
