

ABSTRACT

A washing machine (100) is provided with a water tub (108);
a rotary tub (116) provided rotatably in the water tub (108);
5 and a hydrophilic portion (300) provided at the rotary tub (216).
The washing machine (100) having such structure achieves effects
of inhibiting propagation of mold, inhibiting attachment of
contaminants, and inhibiting attachment of detergents by the
hydrophilic portion (300) being provided on the portions of the
10 rotary tub (116) unreachable by hand and thus, being difficult
to perform maintenance work such as cleaning.
