

ABSTRACT

There is provided a chair-type massager (1) comprising: a seat (2); a backrest (3); and a pair of armrests (4) disposed one at each side of the seat (2) in a horizontal direction so as to extend in a front-rear direction. The armrests (4) each includes a tubular insertion recess part (6) to cover and hold at least a hand (H) of a user, and the insertion recess part (6) extends in the front-rear direction. The insertion recess part (6) is provided at its front portion with separate finger sacks (17) to receive individual fingers (F) of the hand (H). The finger sacks (17) are mounted for rotational motion about a horizontal axis at a front portion of the armrest (4).
