

Abstract

Provided are a transaction delegation method, a transaction delegation system, and a computer program. In this transaction delegation method: a second device that stores account data in a blockchain system
5 receives, by communication outside the blockchain system, delegation data from a first device used by a user, said delegation data delegating the execution of a desired transaction of the user in the blockchain system; a delegation transaction that causes the desired transaction to be executed by an execution smart contract executed from the user's account in the
10 blockchain system is created on the basis of the delegation data transmitted from the first device; and the delegation transaction accompanying the payment of a fee token or a utility token needed to execute a transaction is broadcast to the blockchain system on the basis of the account data.
