

ABSTRACT

A low-cost system which can provide a service, etc. for usage of a facility, etc. by using a mobile terminal is achieved. The
5 present system has a distributing device (100) which distributes a program (SSW) for forming a UI for providing the service for usage of a facility (300) to a mobile terminal (200) of a user. The distributing device manages an area and the SSW associated with the facility, determines whether the mobile terminal of the user exists
10 inside the area or not, and distributes the SSW to the mobile terminal, existing inside the area. Then, the distributing device receives information, which is issued in accordance with an operation of the user for a UI (600) formed by the SSW (500) in the mobile terminal, and notifies an operator of the facility or apparatus in the facility
15 of the information.
