(54) Title: METHOD AND SYSTEM FOR PROCESSING DATA PACKAGES

(57) Abstract: A method, system and non-transitory computer-readable medium for classifying a received data package (100) using a framework (200). The framework (200) comprises at least one classifier (230); a processing component (220) for processing the received data package (100) using the at least one classifier (230), and a database (240) for storing at least a data model and a data set of mappings (420, 470). The at least one classifier (240) is configured to obtain (310) data of the received data package (100) and apply (320) the data set of mappings (420, 470) to the obtained data to generate normalised data (430, 480). The data model is then applied (330) to the normalised data (430, 480) to generate at least one permutation of the normalised data, and the data package is classified (340) based on the at least one permutation of the normalised data.
