

ABSTRACT

The present disclosure relates to a PUSCH indication method, comprising: configuring for a terminal a plurality of sounding reference signal (SRS) resource sets having a "non-codebook" function, a plurality of SRS resources in the SRS resource sets being associated with beam-related information; sending to the terminal a channel state information reference signal (CSI-RS) corresponding to each SRS resource set; performing uplink channel information state detection according to an SRS sent by the terminal, and determining, according to the detection result, a plurality of beams for uplink cooperative transmission and indication information corresponding to each beam; and sending multiple pieces of indication information to the terminal. According to the present disclosure, a plurality of beams for cooperative transmission and indication information corresponding to each beam can be determined; a terminal is instructed by means of multiple pieces of indication information corresponding to the plurality of beams, and the terminal can determine, according to the indication information, the plurality of beams for cooperative transmission and antenna panels corresponding to the plurality of beams, such that by means of cooperative transmission by the plurality of antenna panels, the requirements of a service requiring enhanced PUSCH transmission can be satisfied.
