

ABSTRACT

The present disclosure relates to an auxiliary information sending method and apparatus, an auxiliary information receiving method and apparatus, and a communication apparatus and a storage medium. The auxiliary information sending method comprises: sending first auxiliary information to a second UE, wherein the first auxiliary information is used for indicating, to the second UE, first system information that is required by a first UE. According to the present disclosure, the first UE may give the second UE an indication by means of the first auxiliary information, so as to allow the second UE to learn of system information that is required by the first UE, such that when determining that the first system information has been updated, the second UE may subsequently send the updated first system information to the first UE in a timely manner. Therefore, even if the first UE is not aware that a base station has updated the first system information, the first UE can also acquire the updated first system information from the second UE in a timely manner.
