

ABSTRACT

The present invention aims to provide a method for producing a pattern-containing liquid and a system for
5 producing a pattern-containing liquid each having a high flexibility in designing, in liquid, a pattern that can generate any sense such as color vision, taste, flavor, mouthfeel, or texture. The present invention relates to a method for producing a pattern-containing liquid, including
10 discharging, using a position-controllable nozzle, a pattern-forming material in which first micro-sized particles containing a first edible organic substance are dispersed in a first liquid into a second liquid, thereby forming a pattern from the first micro-sized particles.
