Abstract

IMPROVED AUDIO/VIDEO TELEPHONE COMMUNICATIONS

This invention relates to an arrangement for supplying audio and video signals from separate sources (2,6) to a video telecommunication station (1). In one embodiment, the audio is supplied, for example, by a stock broker or agent (at 2), while the video is supplied by a separate source (6) controlled by the agent. Advantageously, pre-planned video from a common source, or video from a separate camera, can be supplied to a caller (1) along with the audio message from the agent (2).
