

ABSTRACT

To efficiently transport an energy source such as electricity to any reception facility without using a power transmission cable. An energy transport system 100 comprises: a transport ship 10 that is equipped with holding means for an energy source; a supply facility 20 that supplies the energy source to the holding means of the transport ship 10; and a reception facility 30 that receives the energy source supplied from the holding means of the transport ship 10. Examples of the energy source held in the holding means of the transport ship 10 include electricity and hydrogen.
