

ABSTRACT

An attachment device adaptable to be positioned between a primary and a secondary eyewear including a protective pad for preventing the rearward facing surface of the primary and forward facing surface of the secondary lens from being in direct contact; an engagement means for attaching said protective pad to the forward facing surface of the primary or the rearward facing surface of the secondary lens; wherein the protective pad creates a frictional resistance between the primary and secondary lens.

10 A spectacle frame arrangement including a primary frame enclosing two primary lens portions, a secondary frame enclosing two secondary lens portions, a bridge portion of the primary lens, a bridge portion of the secondary lens, and an attachment device.

15 A method of attaching an attachment device according to any one of the preceding claims including attaching a protective pad onto the engagement means, and engaging said engagement means onto the forward facing portion of the primary lens or the rearward facing portion of the secondary lens.
