

ESCALATOR APPARATUS

adapted for a wheelchair

FIGURE 10 TO ACCOMPANY ABSTRACT

ABSTRACT

5 An escalator apparatus has a specified group of
steps (6,7,8) which form a wheelchair mounting surface
(6F,7F,8F) for carrying a wheelchair (18) or the like.
A retractable wheel-stop (13) moves from the edge
portion of the wheelchair mounting surface at the lower
10 floor side obliquely upward and toward the lower floor
side, and the top end portion of the wheel-stop (13)
moves on a locus progressively directed toward the wheel
of the wheelchair.
