

ELECTRONIC IDENTIFICATION TAG

Abstract of the Disclosure

5 An electronic identification tag is made
up of at least one cover strip and a carrier strip
having an antenna and transponder mounted thereon,
and an adhesive to secure the strips together such
that the antenna is interposed between the strips,
10 the transponder being pre-programmed to generate a
signal having a unique code correlated with indicia
on the tag to identify a passenger or luggage. The
tag further lends itself well to a novel method of
tracking luggage and passengers in a transportation
15 facility.
