ABSTRACT

The maintenance management section receives signals indicative of the status of each part to be
5 checked in an elevator. The time judgement part compares time of a timer with the content of an inspection schedule table, and when the current time approaches to or has lapsed the inspection time, the processing stored in the table in advance is carried out. The processing
10 is a warning operation which puts some restrictions on the availability of service of the elevator, i.e., stoppage of the normal display for a predetermined time, for example. After inspection or maintenance, the inspection schedule table is rewritten with the time of
15 the next inspection or maintenance. With this, the transportation facilities can urge a caretaker to perform the inspection or maintenance, without giving passengers any serious inconvenience such as a sudden stop of service operation, and without providing any additional
20 warning device.
