

ABSTRACT

CONTACTLESS VALIDATION METHOD AND APPARATUS

- 5 Validation of one or more transactions for a service is facilitated through the use of a
RFID technology. A validation station includes an RFID reader for contactless
reading of an RFID tag proximate to the RFID reader reading an RFID tag. The
validation station responds to the contactless reading of an RFID identifier of an RFID
tag to cause retrieval of transaction information for transactions recorded in
10 transaction records associated with the RFID identifier for validation of a tax refund in
respect of the transactions.
