

Abstract

A first scum removal device of a conduit includes a scum peeling device and a water ejection nozzle that moves
5 the scum toward a scum pit at a terminal end of the conduit
body, a second scum removal device of a primary
sedimentation basin includes a pipe skimmer, a scum guide
mechanism, and a water ejection nozzle that moves the scum
toward the pipe skimmer, a third scum removal device of a
10 final sedimentation basin includes a pipe skimmer and a
water ejection nozzle that moves the scum toward the pipe
skimmer, and the water ejection nozzle for the final
sedimentation basin does not make water muddy since an
amount of water ejection of the water ejection nozzle for
15 the final sedimentation basin less than an amount of water
ejection of the water ejection nozzle for the conduit.
