

ABSTRACT

Reception means 120 receives data indicating water temperature of a body of water through which a vessel voyages, vessel speed, and a period for which those values are maintained. From storage means 121, index value acquisition means 123 reads out a decrease amount of anti-fouling paint corresponding to the water temperature and vessel speed received by reception means 120. Index value specification means 124 specifies a decrease amount of anti-fouling paint in the period by multiplying the length of time of the period received by reception means 120 by the decrease amount read out by index value acquisition means 123. Remaining amount acquisition means 125 integrates the decrease amounts of the anti-fouling paint specified by index value specification means 124 at the time of coating with the anti-fouling paint and onward. Remaining amount specification means 126 specifies a current paint film thickness of the anti-fouling paint by subtracting the decrease amount of the anti-fouling paint integrated by remaining amount acquisition means 125 from the paint film thickness at the time of coating with the anti-fouling paint.
