ABSTRACT

A mounting port that is provided includes a shutter that raises little dust and has a simple opening and closing mechanism. The mounting port allows an article to be relayed between a worker and a conveying apparatus or a processing device in a clean room. The mounting port includes an article mounting stand; an apparatus-side opening that allows a conveying apparatus or a processing device to pass an article to and from the mounting stand; a passageway-side opening that faces a worker passageway; shutters that are provided at positions for opening and closing the apparatus-side opening and comprise arc-shaped plates or plates bent like an arc; and a swing mechanism that swings the shutters about predetermined axes between a state in which the apparatus-side opening is opened and a state in which the apparatus-side opening is closed.
