BOARD CONNECTING ELECTRICAL CONNECTOR

ABSTRACT OF THE DISCLOSURE

Each of plural contacts has a contact section held by a first housing and made contact with a mating contact, a connection section held by a second housing and connected to a board , and a flexible linking section linking the contact section and the connection section. The contact section can move with play relative to the connection section. Each of contacts has a bending part in the flexible linking part formed in a different position from that of an adjacent contact along its length. The first housing and the second housing have a protrusion extending from one side to the other side and a recess formed in the other side where an upper part of the protrusion fits in with play.
