(54) Title: ELECTRONIC APPARATUS WITH DISPLAY SHARED BY DIFFERENT ELECTRONIC MODULES

(57) Abstract

A portable electronic apparatus comprises display means including a screen (2) and configured to be contemporaneously responsive to display control signals from a plurality of electronic modules (6, 7) so that the screen (2) is shared by said modules. Thus, the modules (6, 7) are separately responsible for data/signal processing functions and the display means is provided so that the different data/signal processing functions of the modules (6, 7) can share the display (2). This is different from the case of a portable computer with an ancillary card because, in the conventional portable computer, the computer's microprocessor generates the display control signals related to the operation of the ancillary card.
