Abstract

PACKAGE-ON-PACKAGE USING THROUGH-HOLE VIA DIE ON SAW STREETS

A semiconductor package-on-package (PoP) device includes a first die incorporating a through-hole via (THV) disposed along a peripheral surface of the first die. The first die is disposed over a substrate or leadframe structure. A first semiconductor package is electrically connected to the THV of the first die, or electrically connected to the substrate or leadframe structure. An encapsulant is formed over a portion of the first die and the first semiconductor package. (Fig.41)
